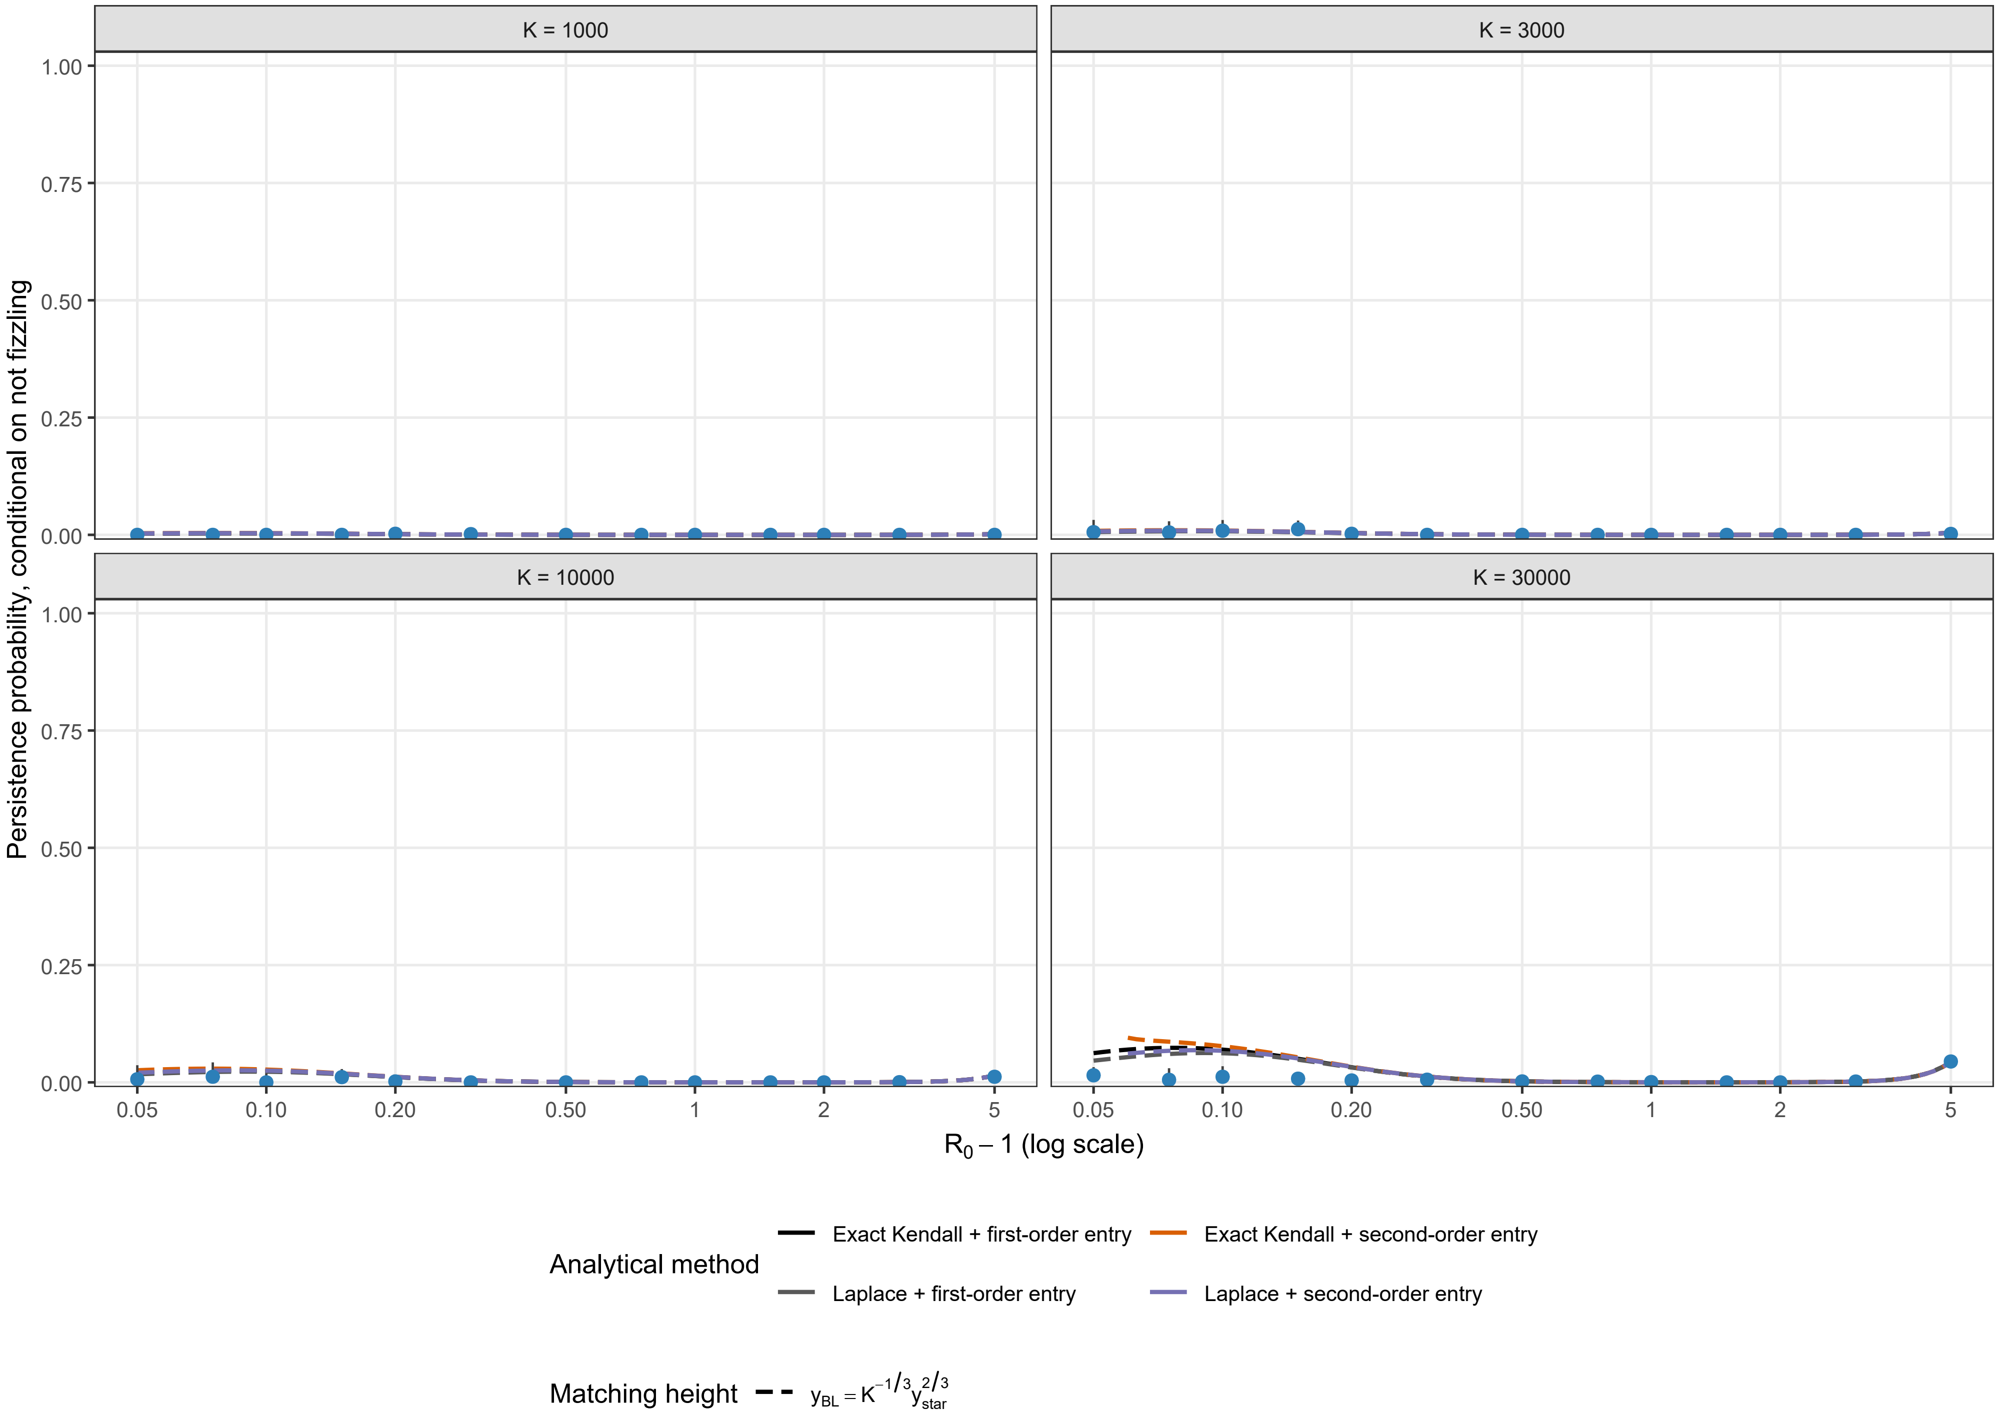
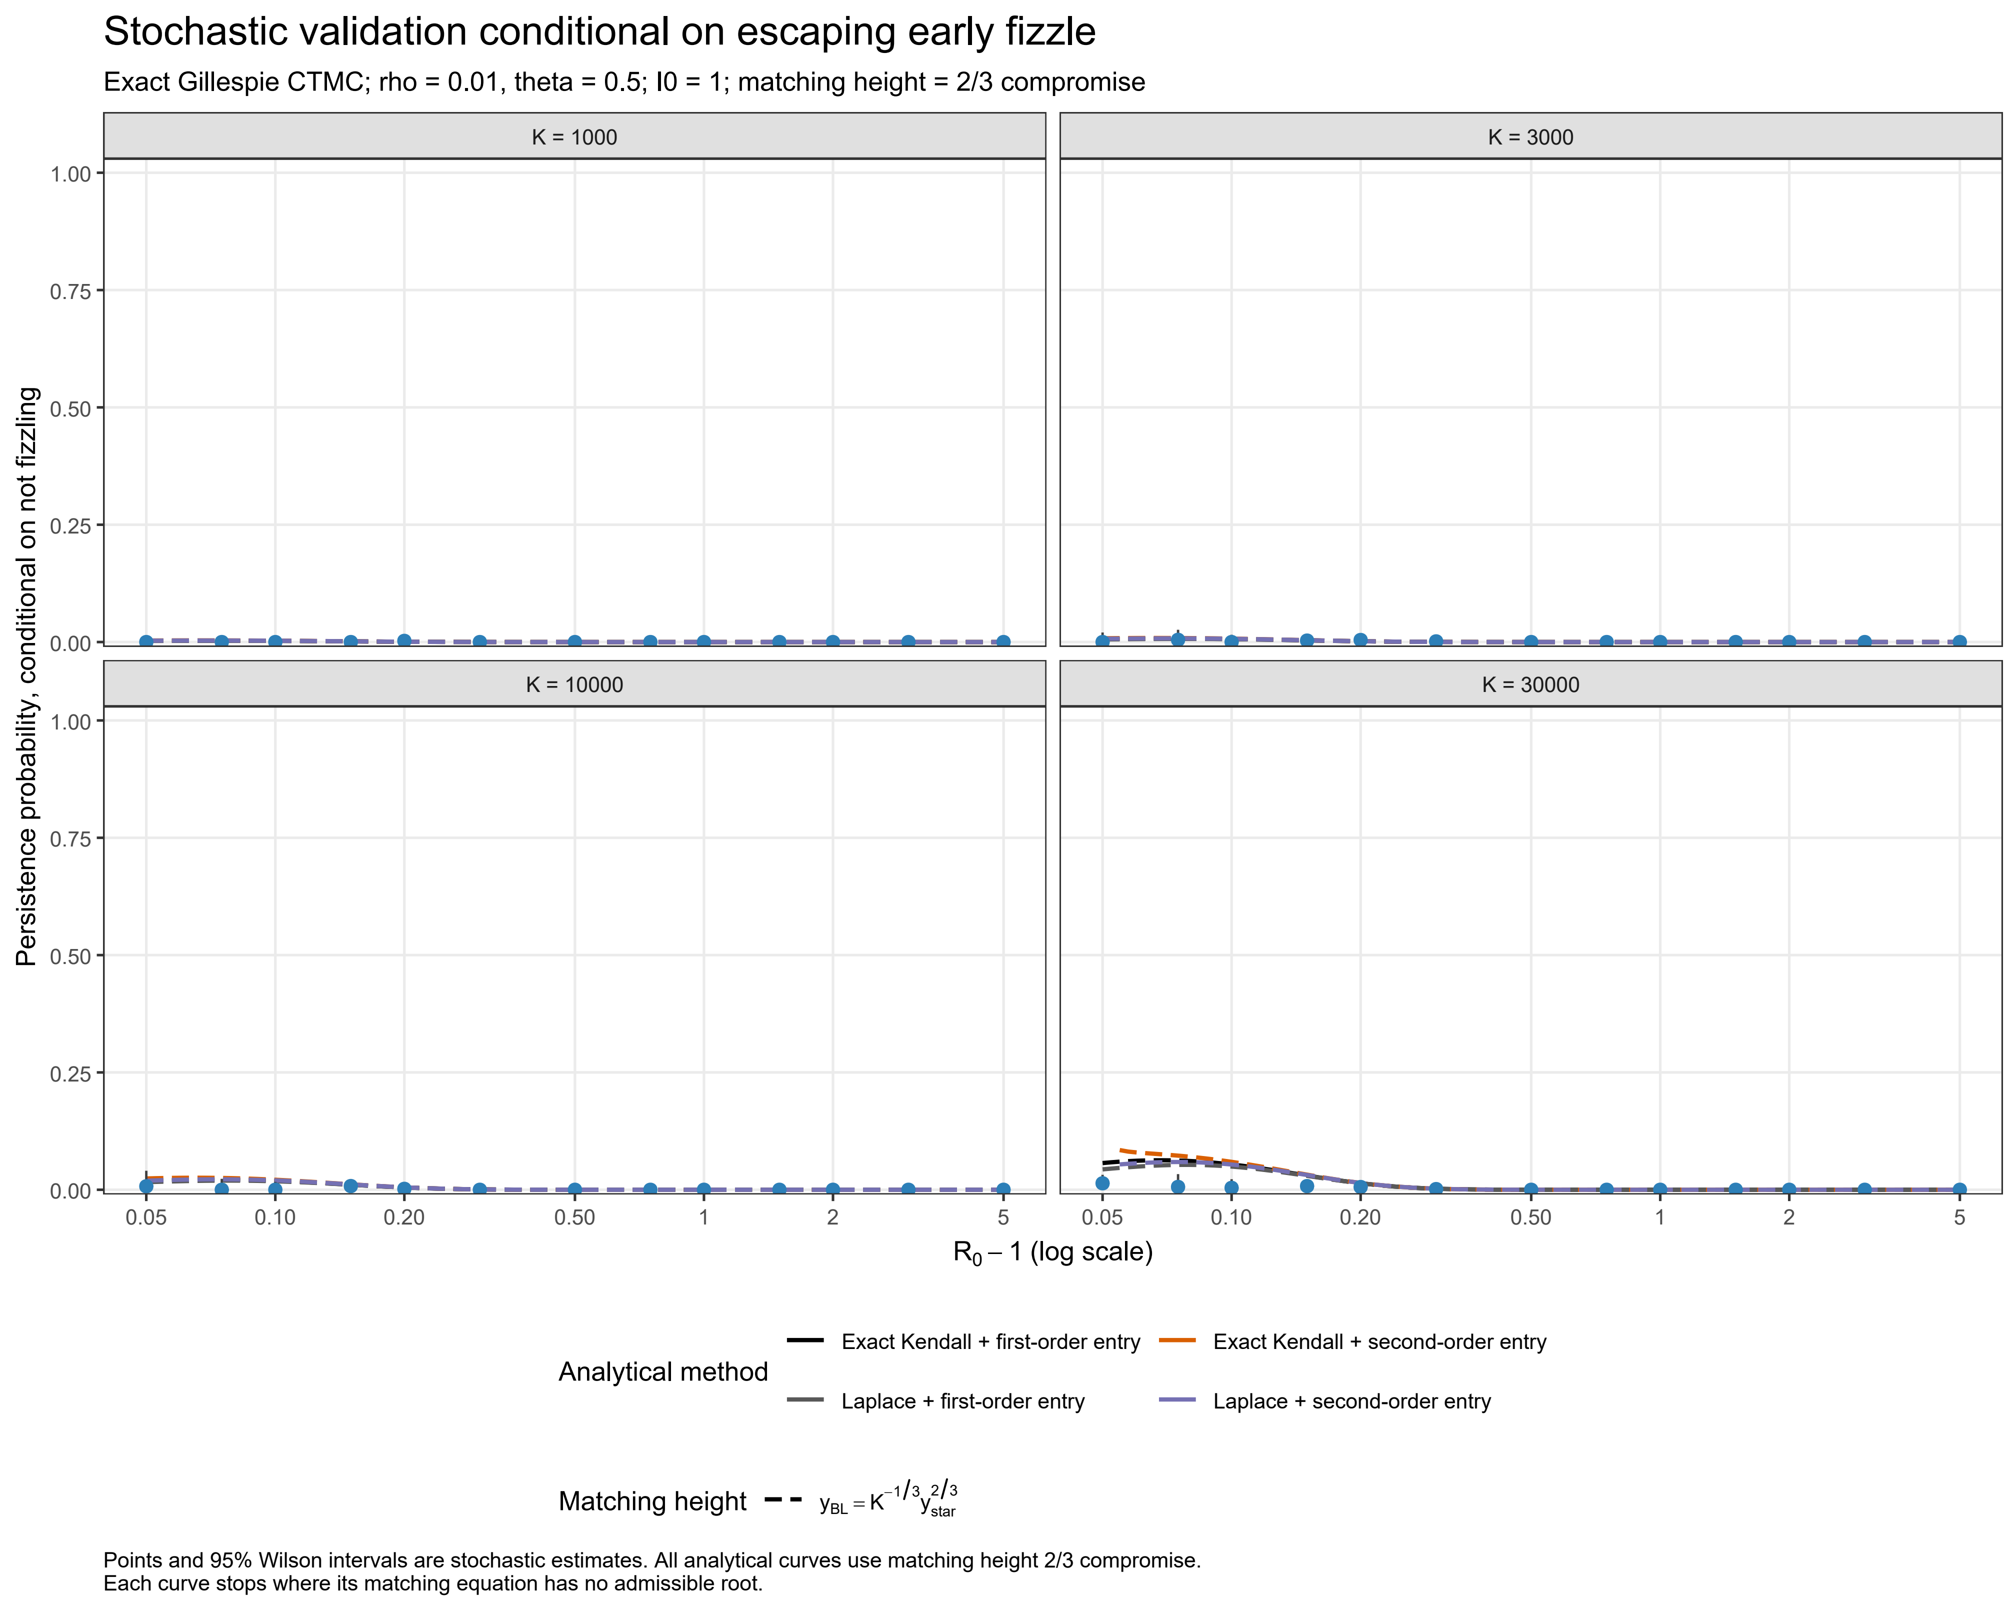
Stochastic validation conditional on escaping early fizzle

Exact Gillespie CTMC; rho = 0.01, theta = 0; I0 = 1; matching height = 2/3 compromise



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.



Stochastic validation conditional on escaping early fizzle
Exact Gillespie CTMC; rho = 0.01, theta = 0.5; I0 = 1; matching height = 2/3 compromise

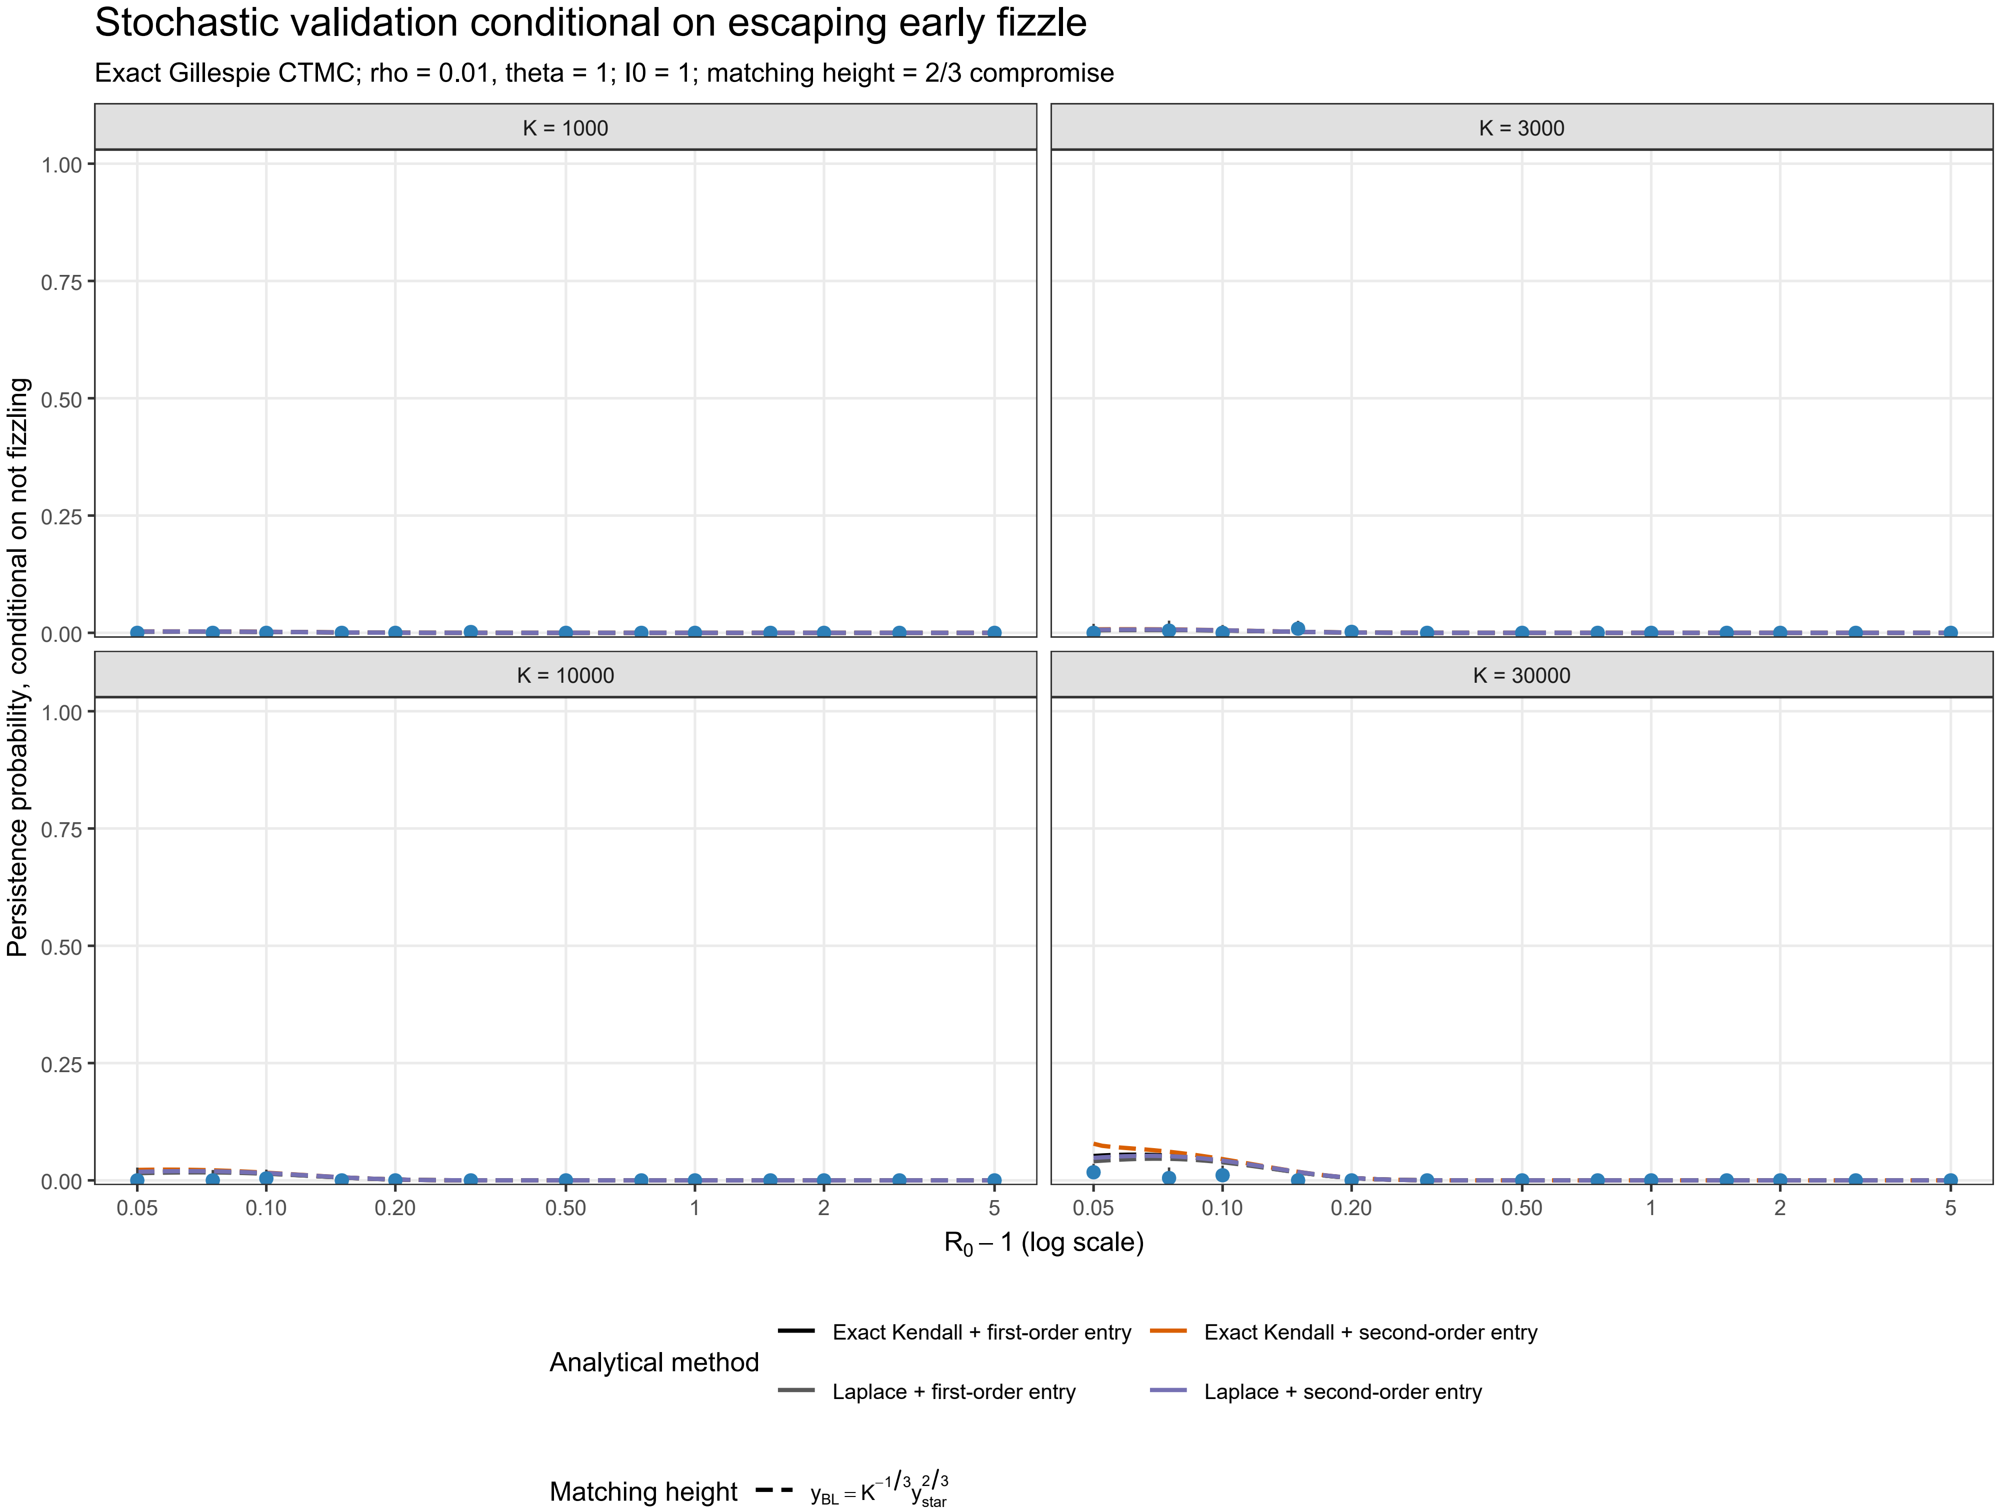
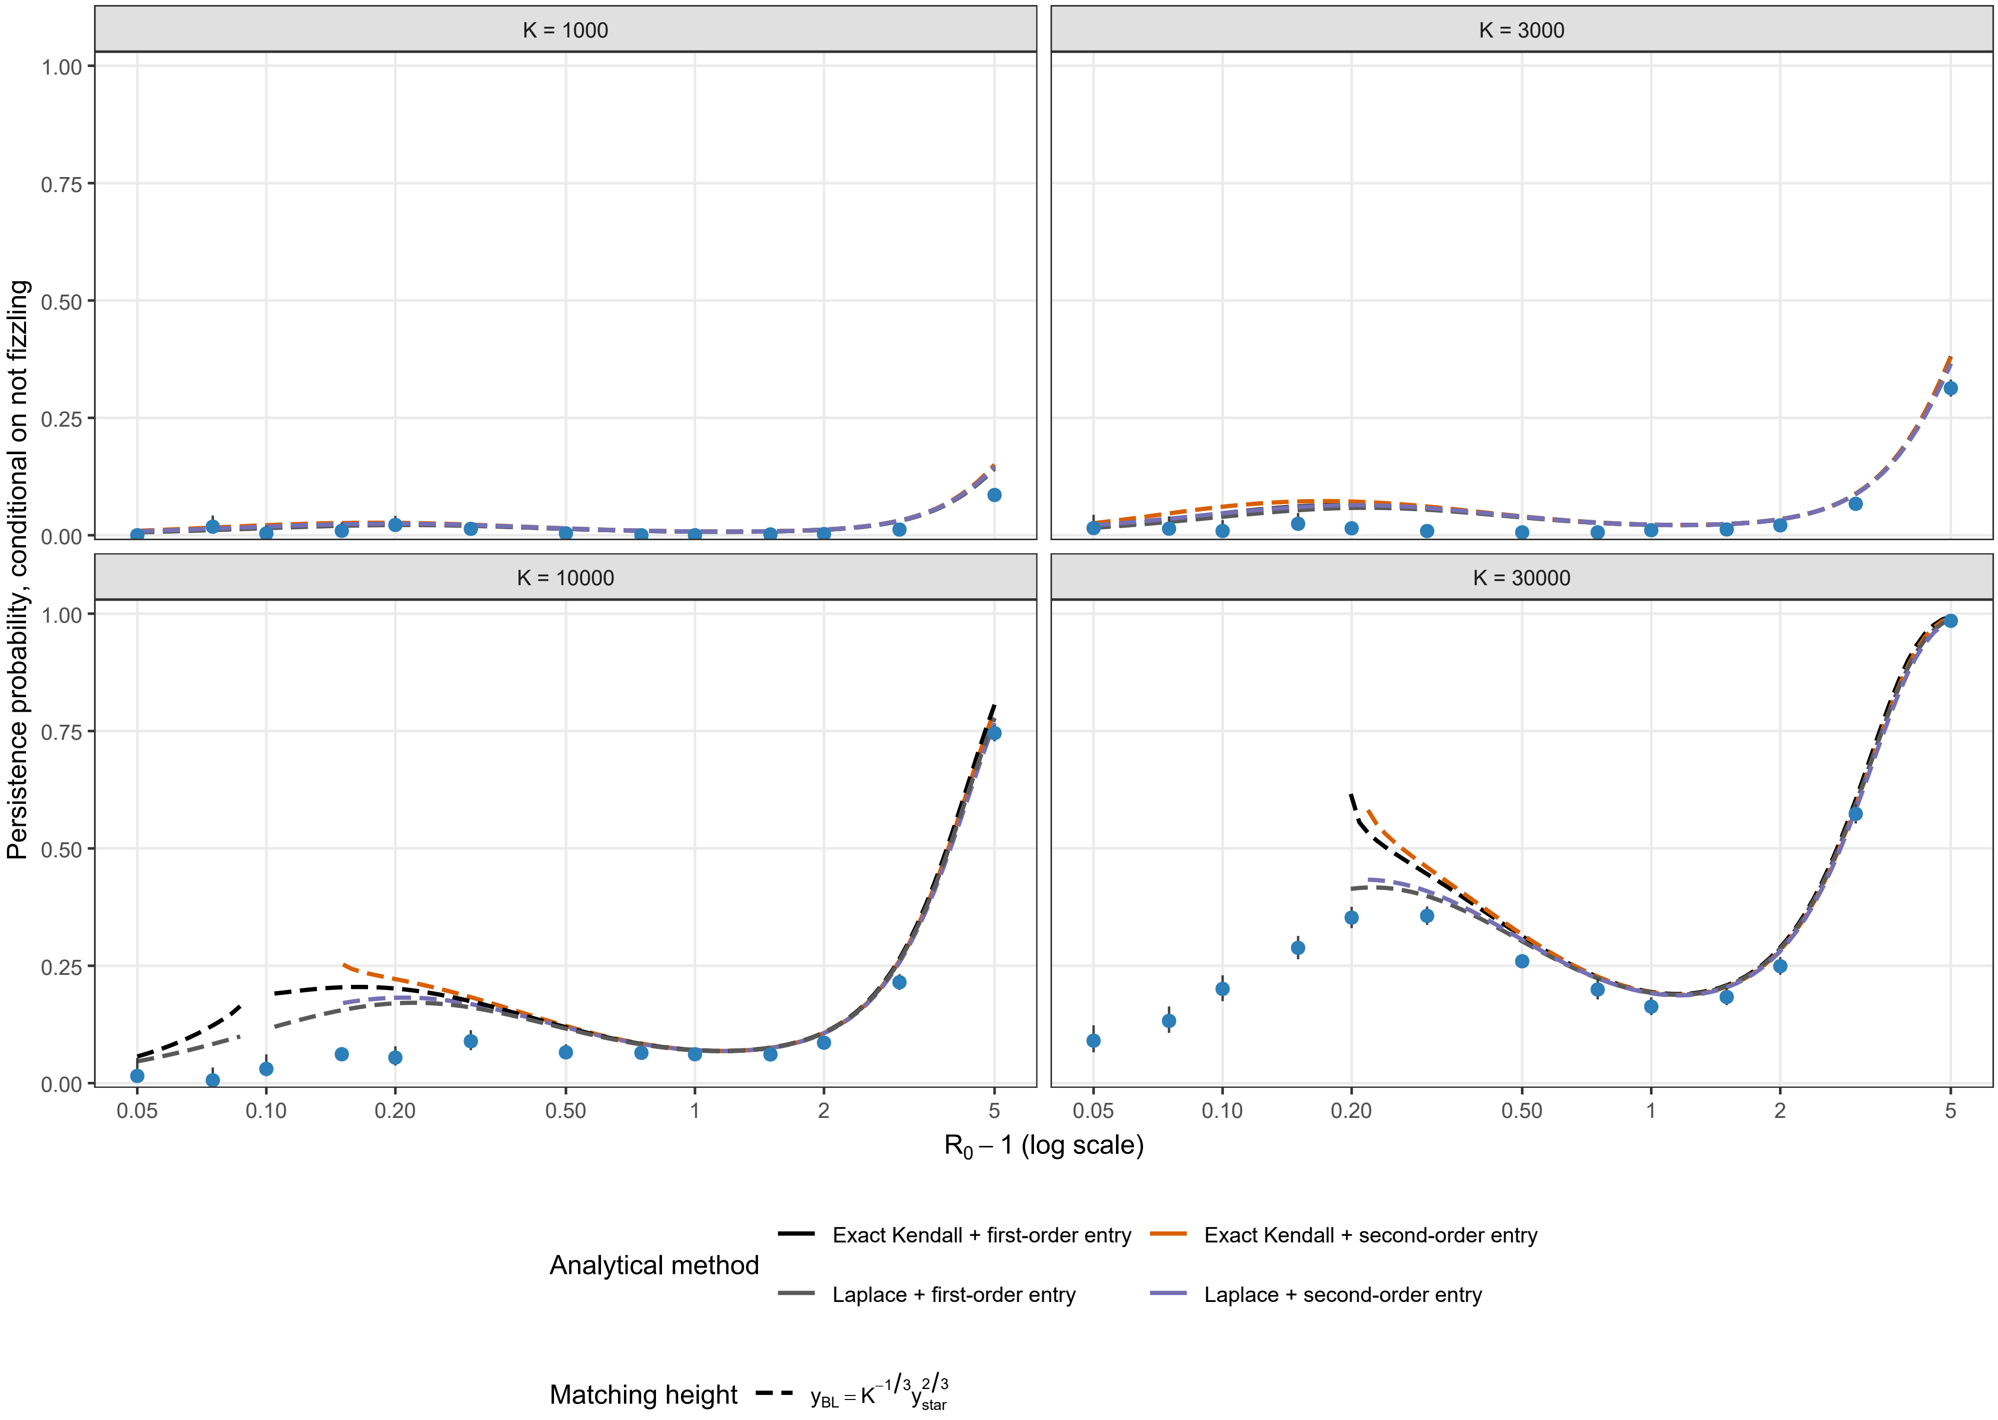
Laplace + second-order entry
Matching height
$y_{BL} = K^{-1/3} y_{star}^{2/3}$
Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.



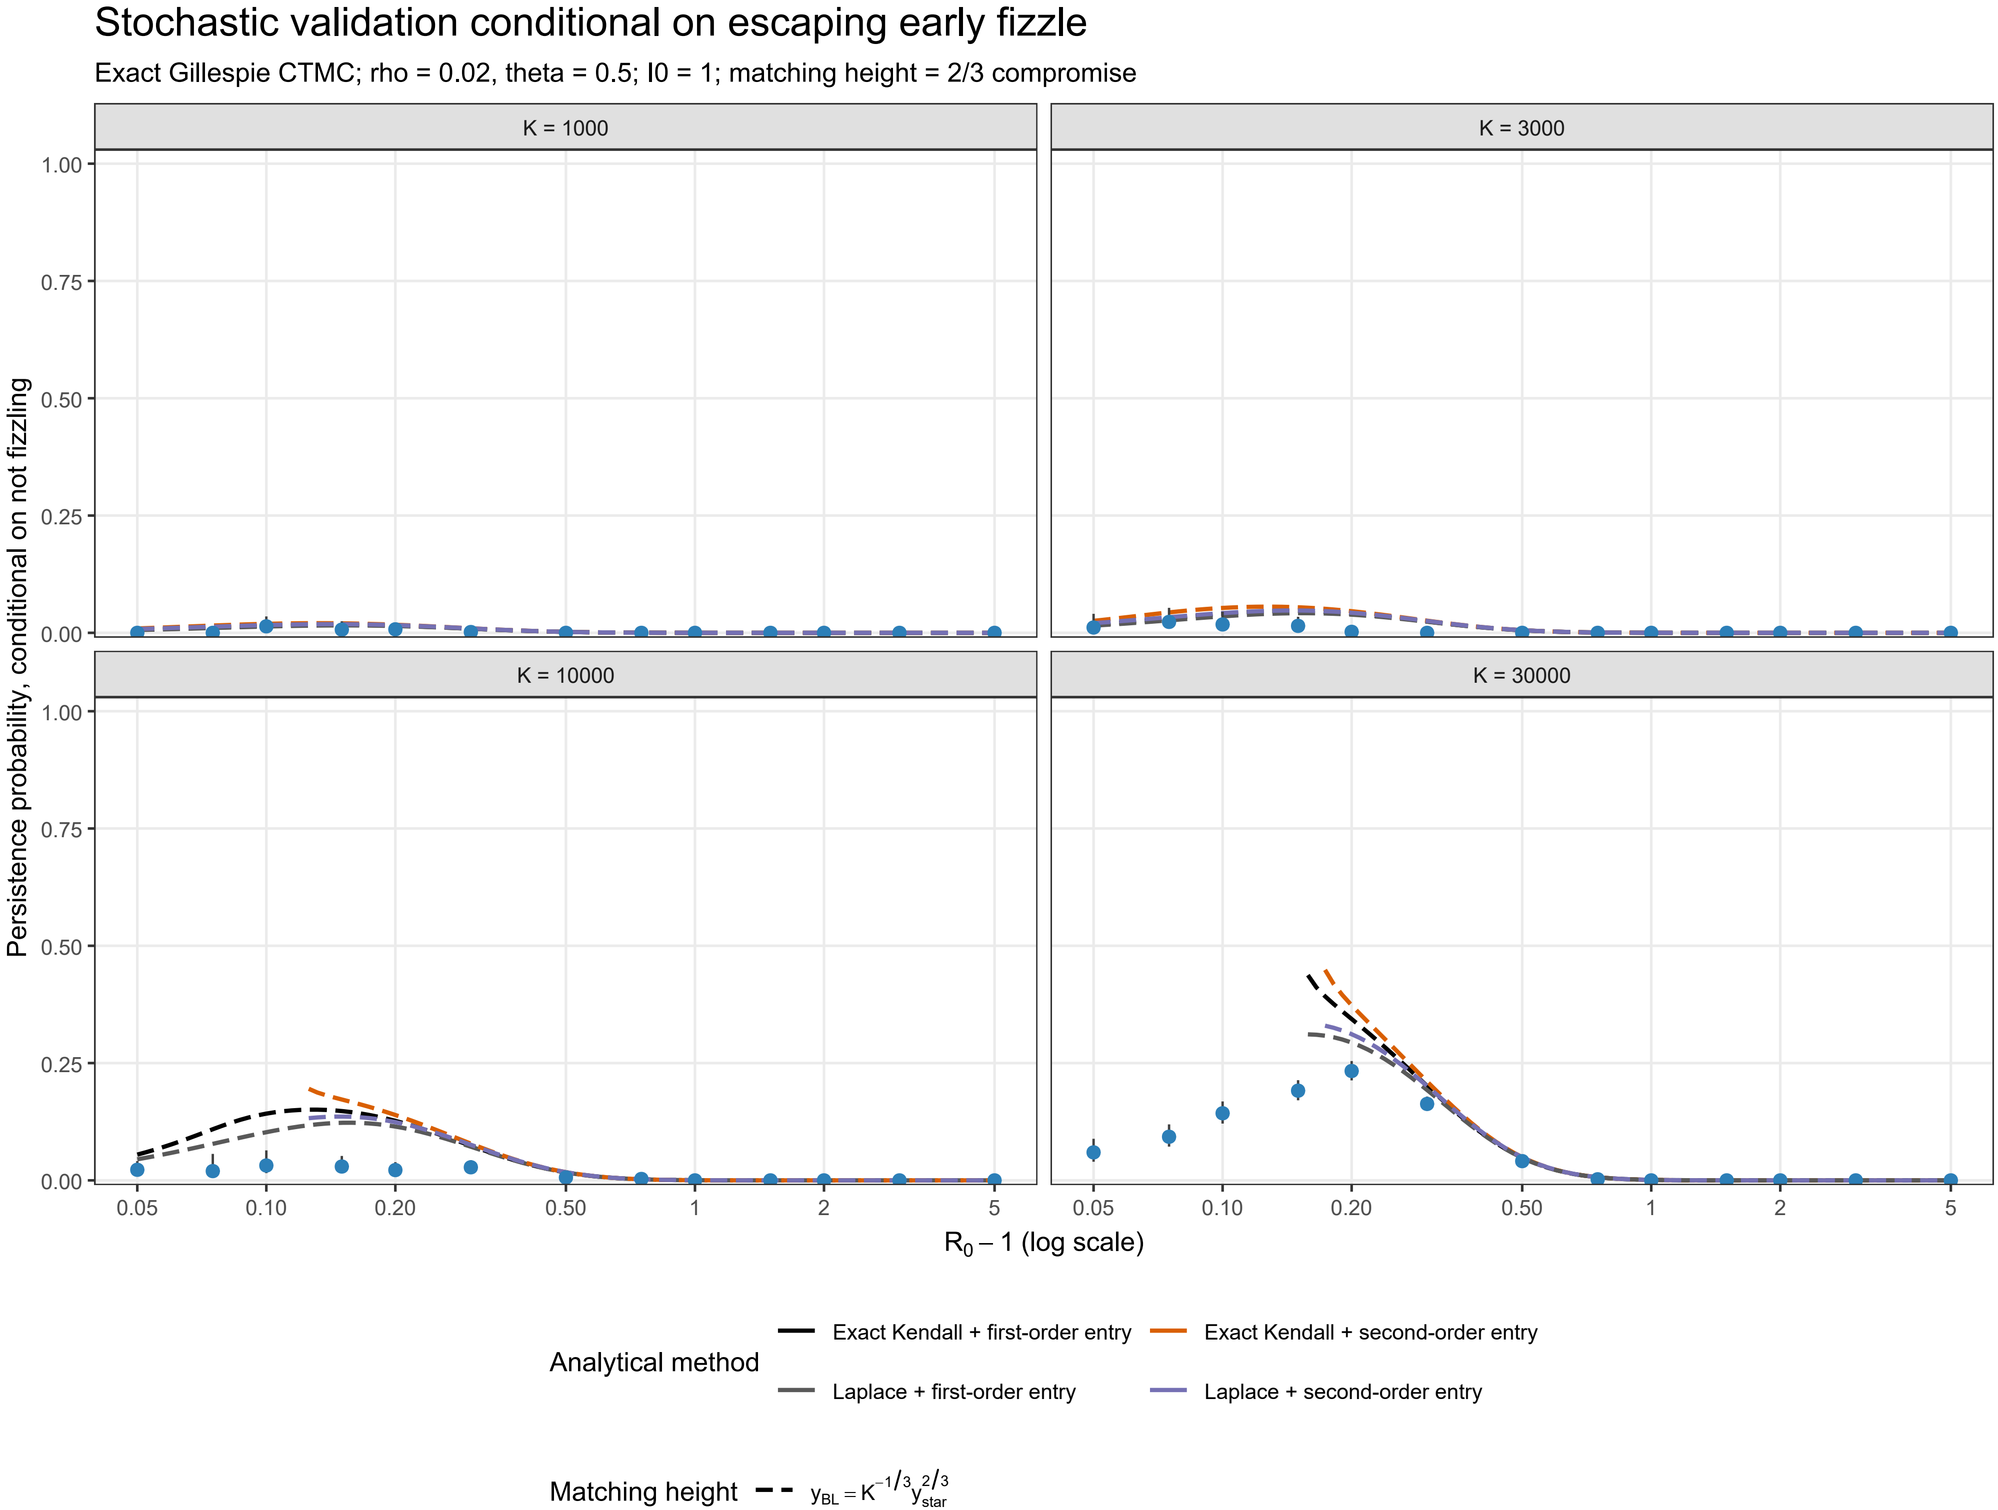
Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

Exact Gillespie CTMC; rho = 0.02, theta = 0; I0 = 1; matching height = 2/3 compromise



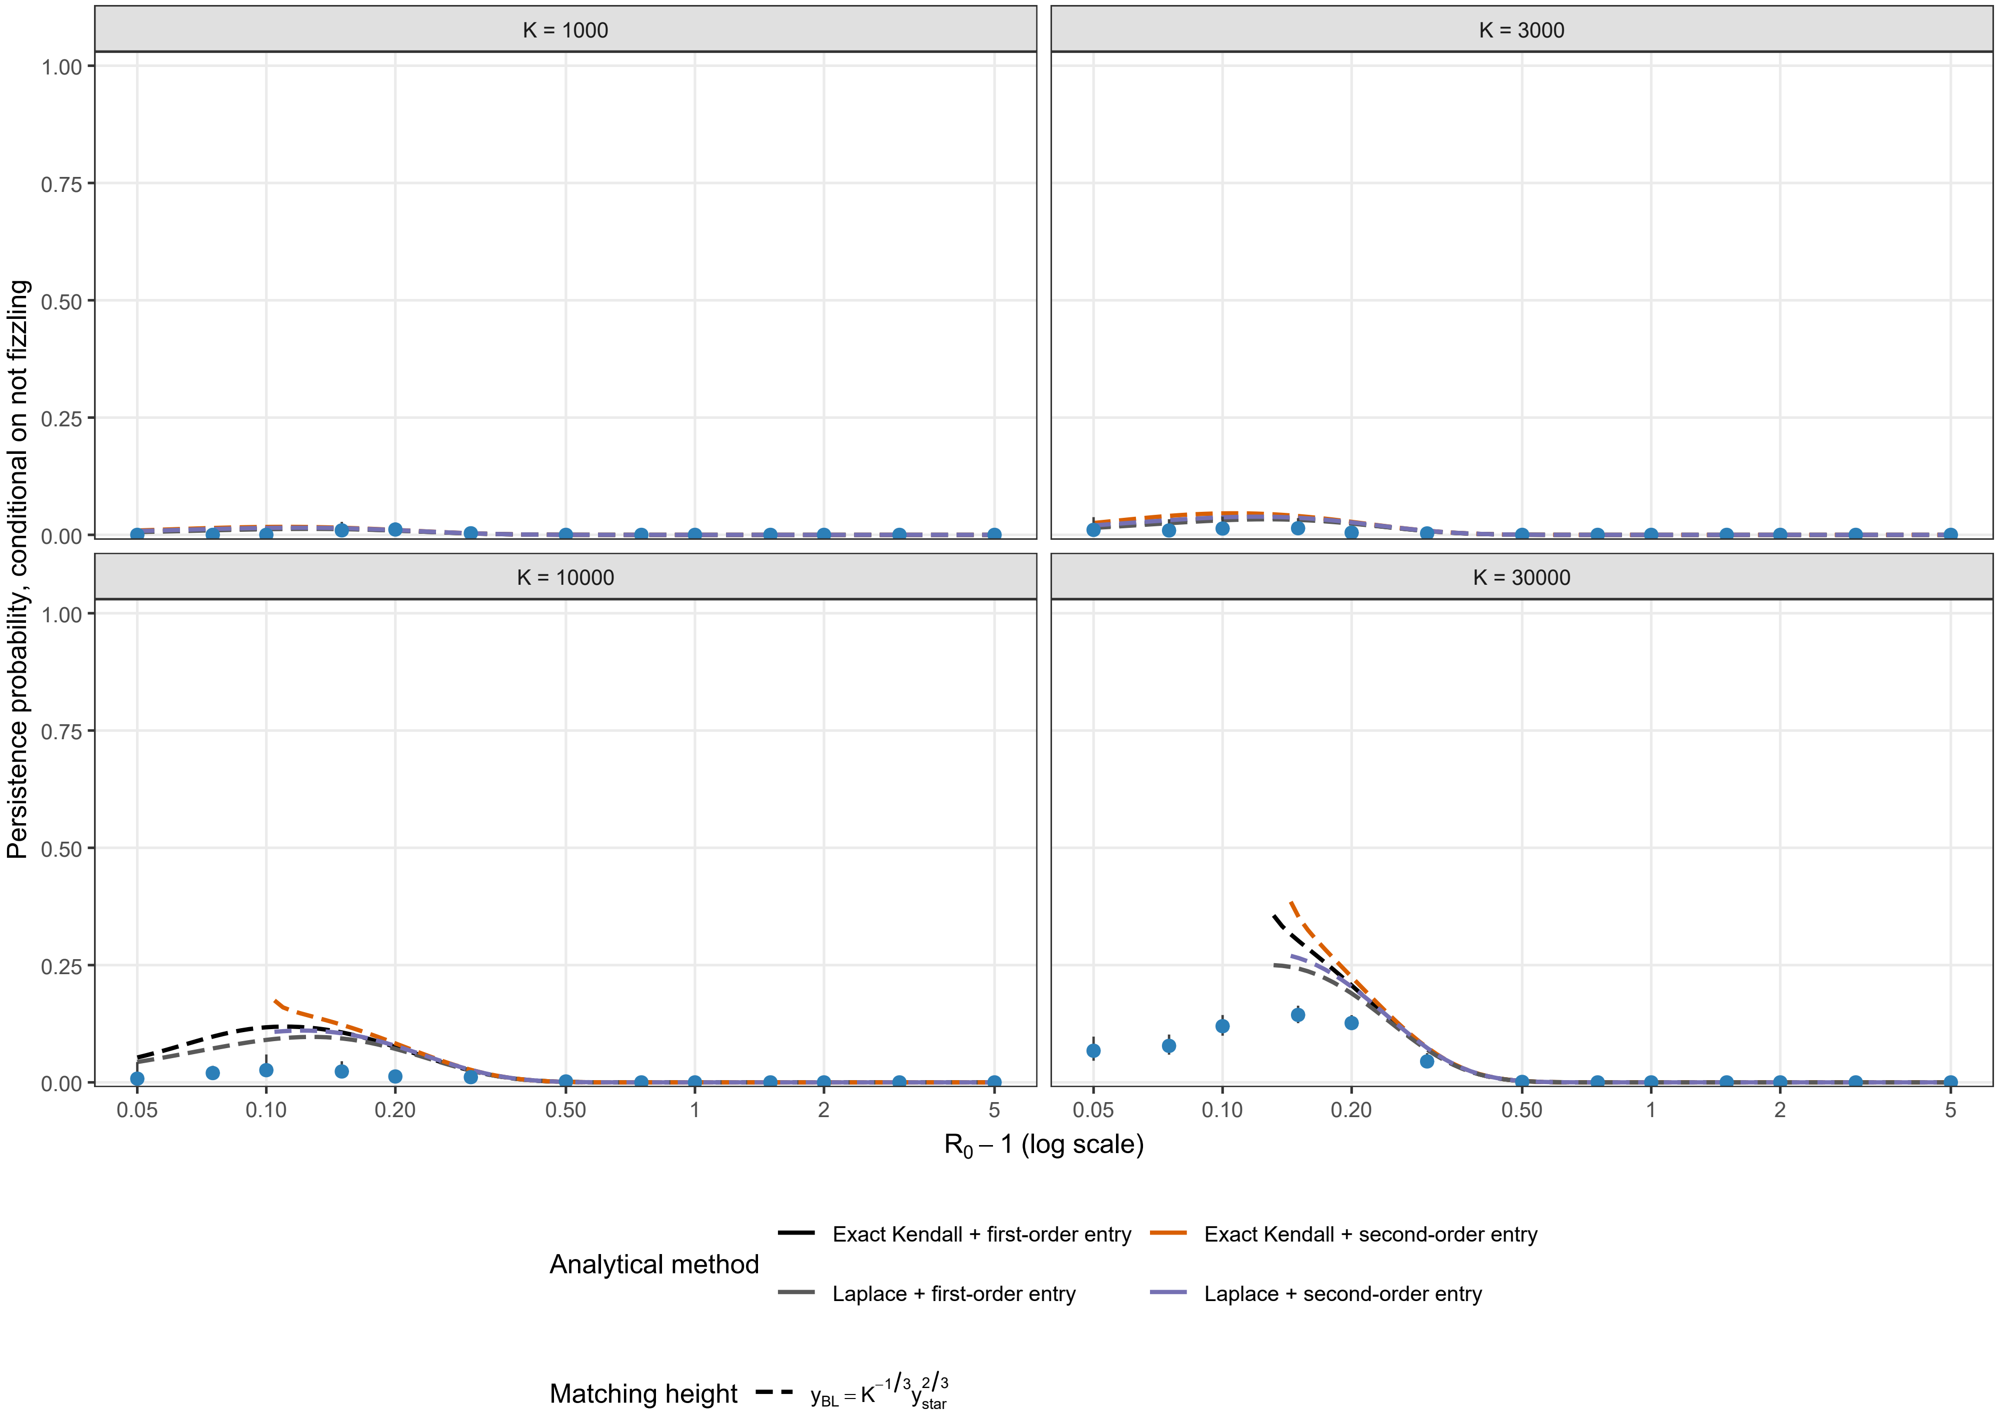
Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

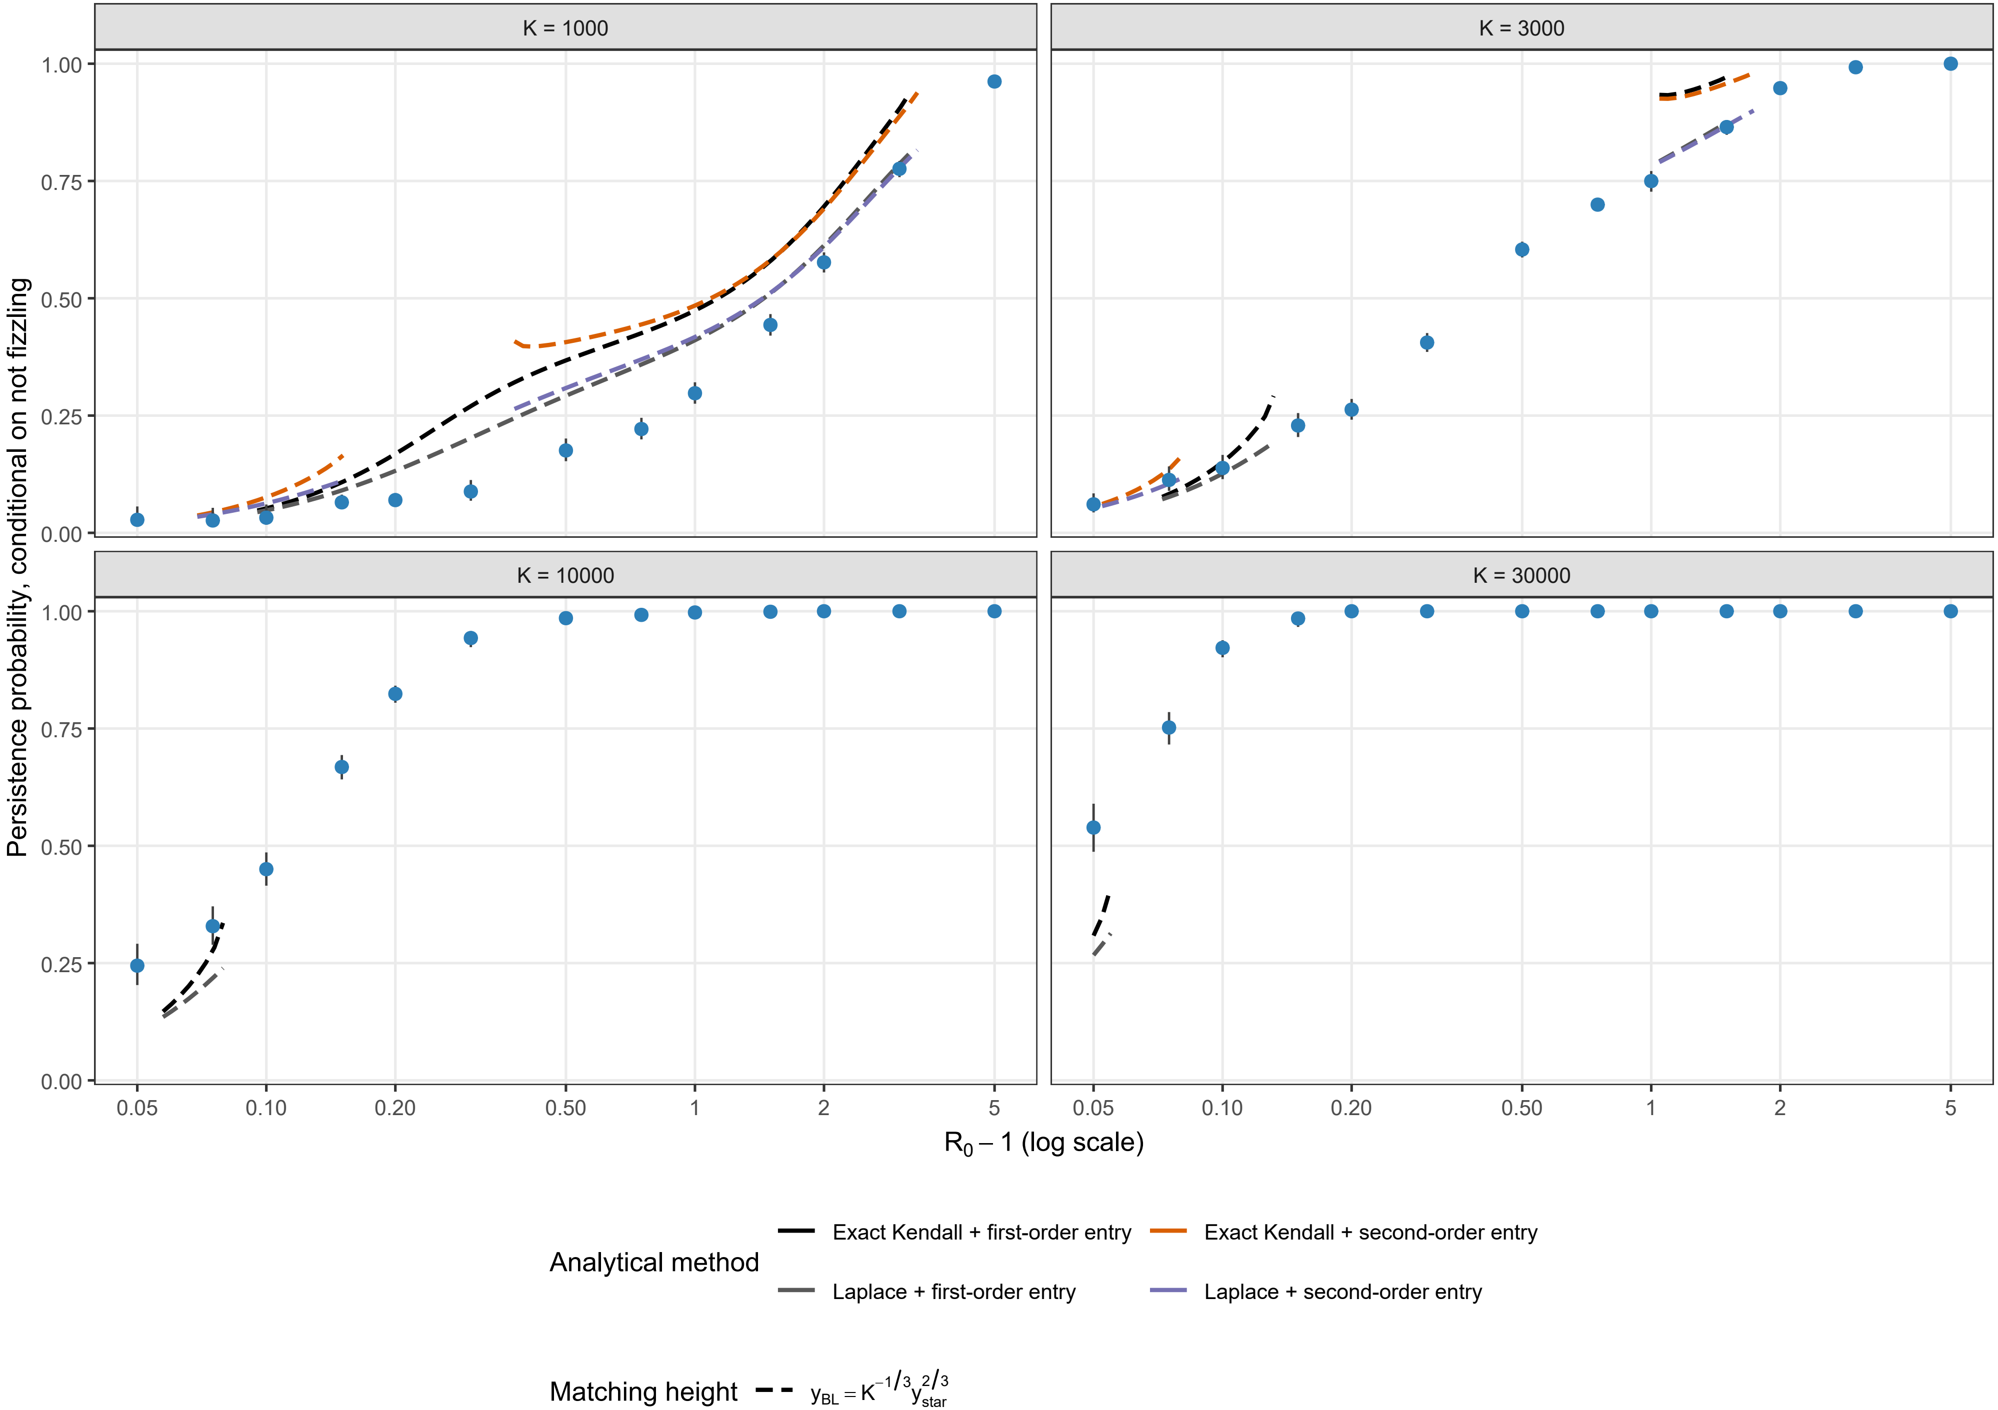
Exact Gillespie CTMC; rho = 0.02, theta = 1; I0 = 1; matching height = 2/3 compromise



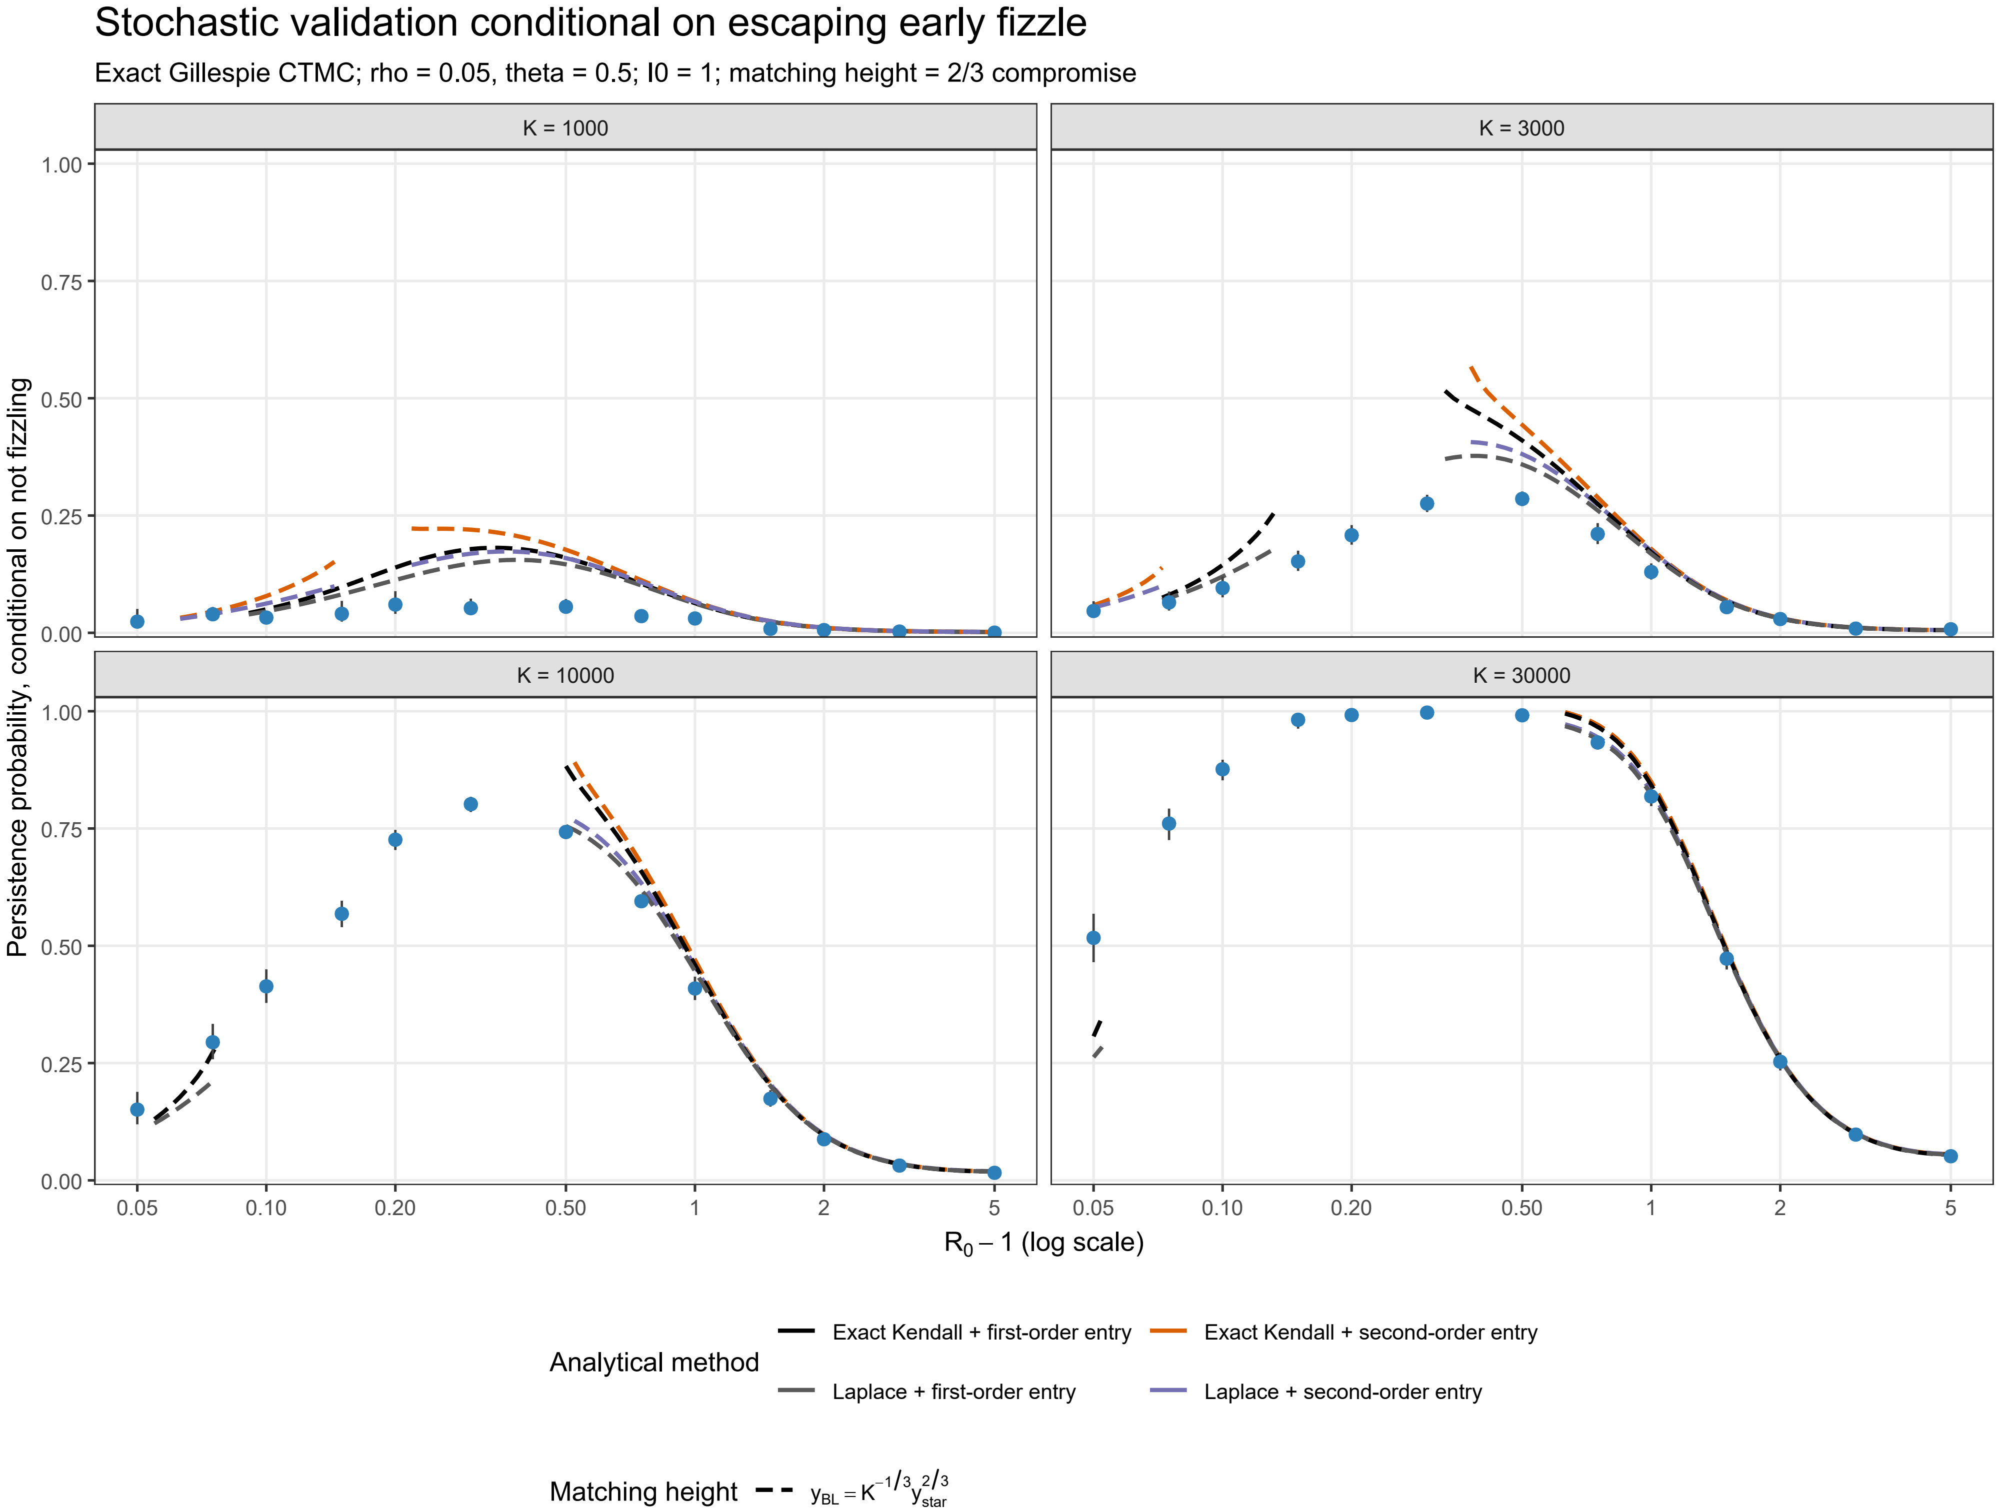
Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

Exact Gillespie CTMC; rho = 0.05, theta = 0; I0 = 1; matching height = 2/3 compromise



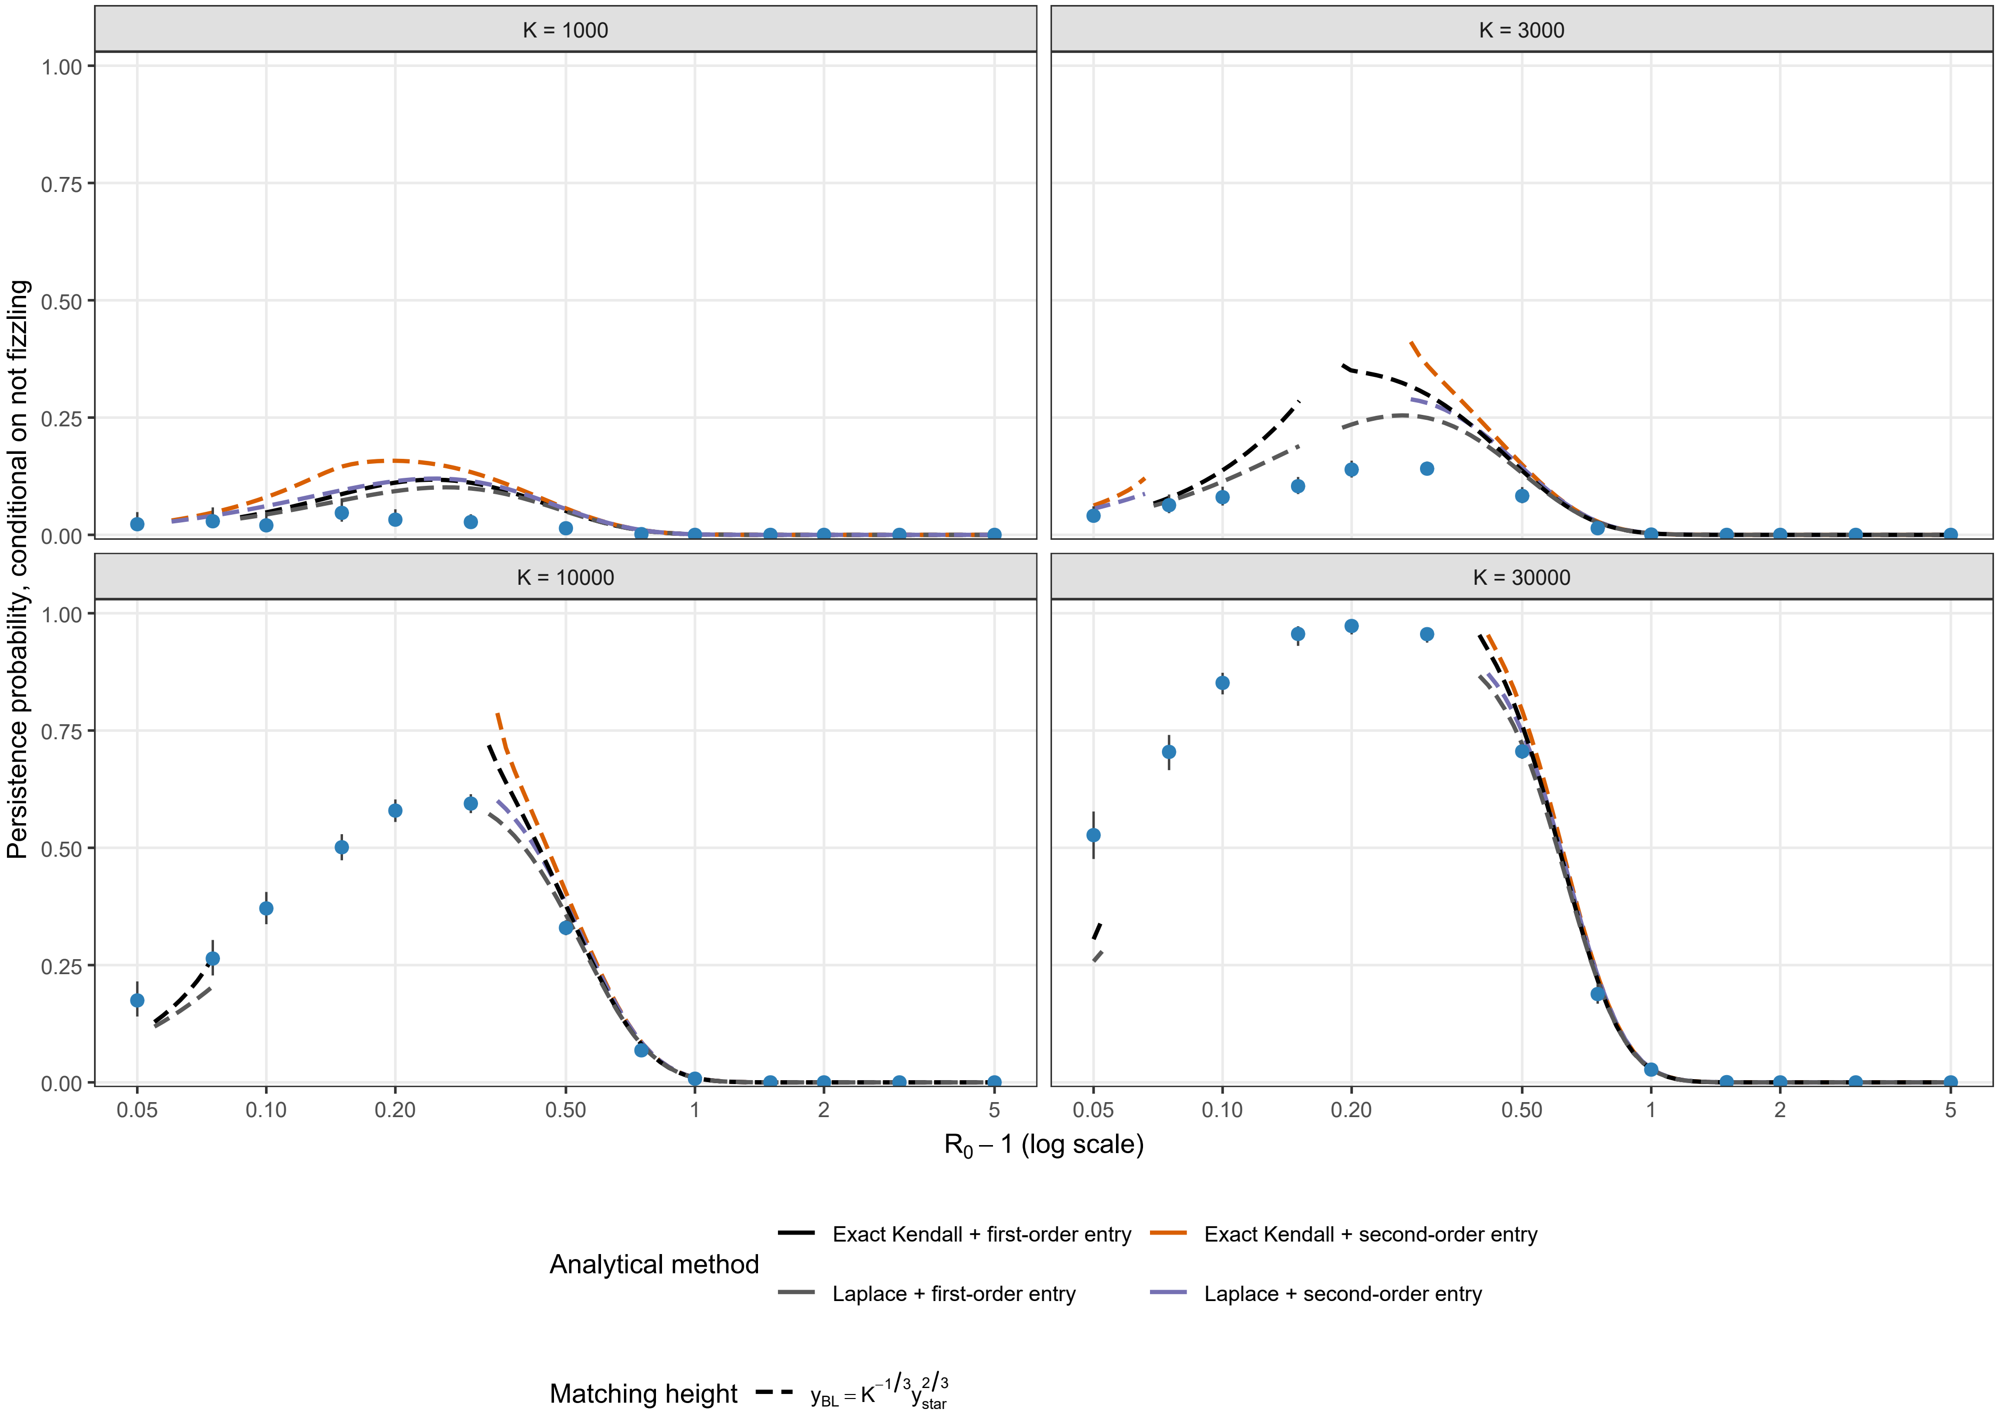
Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

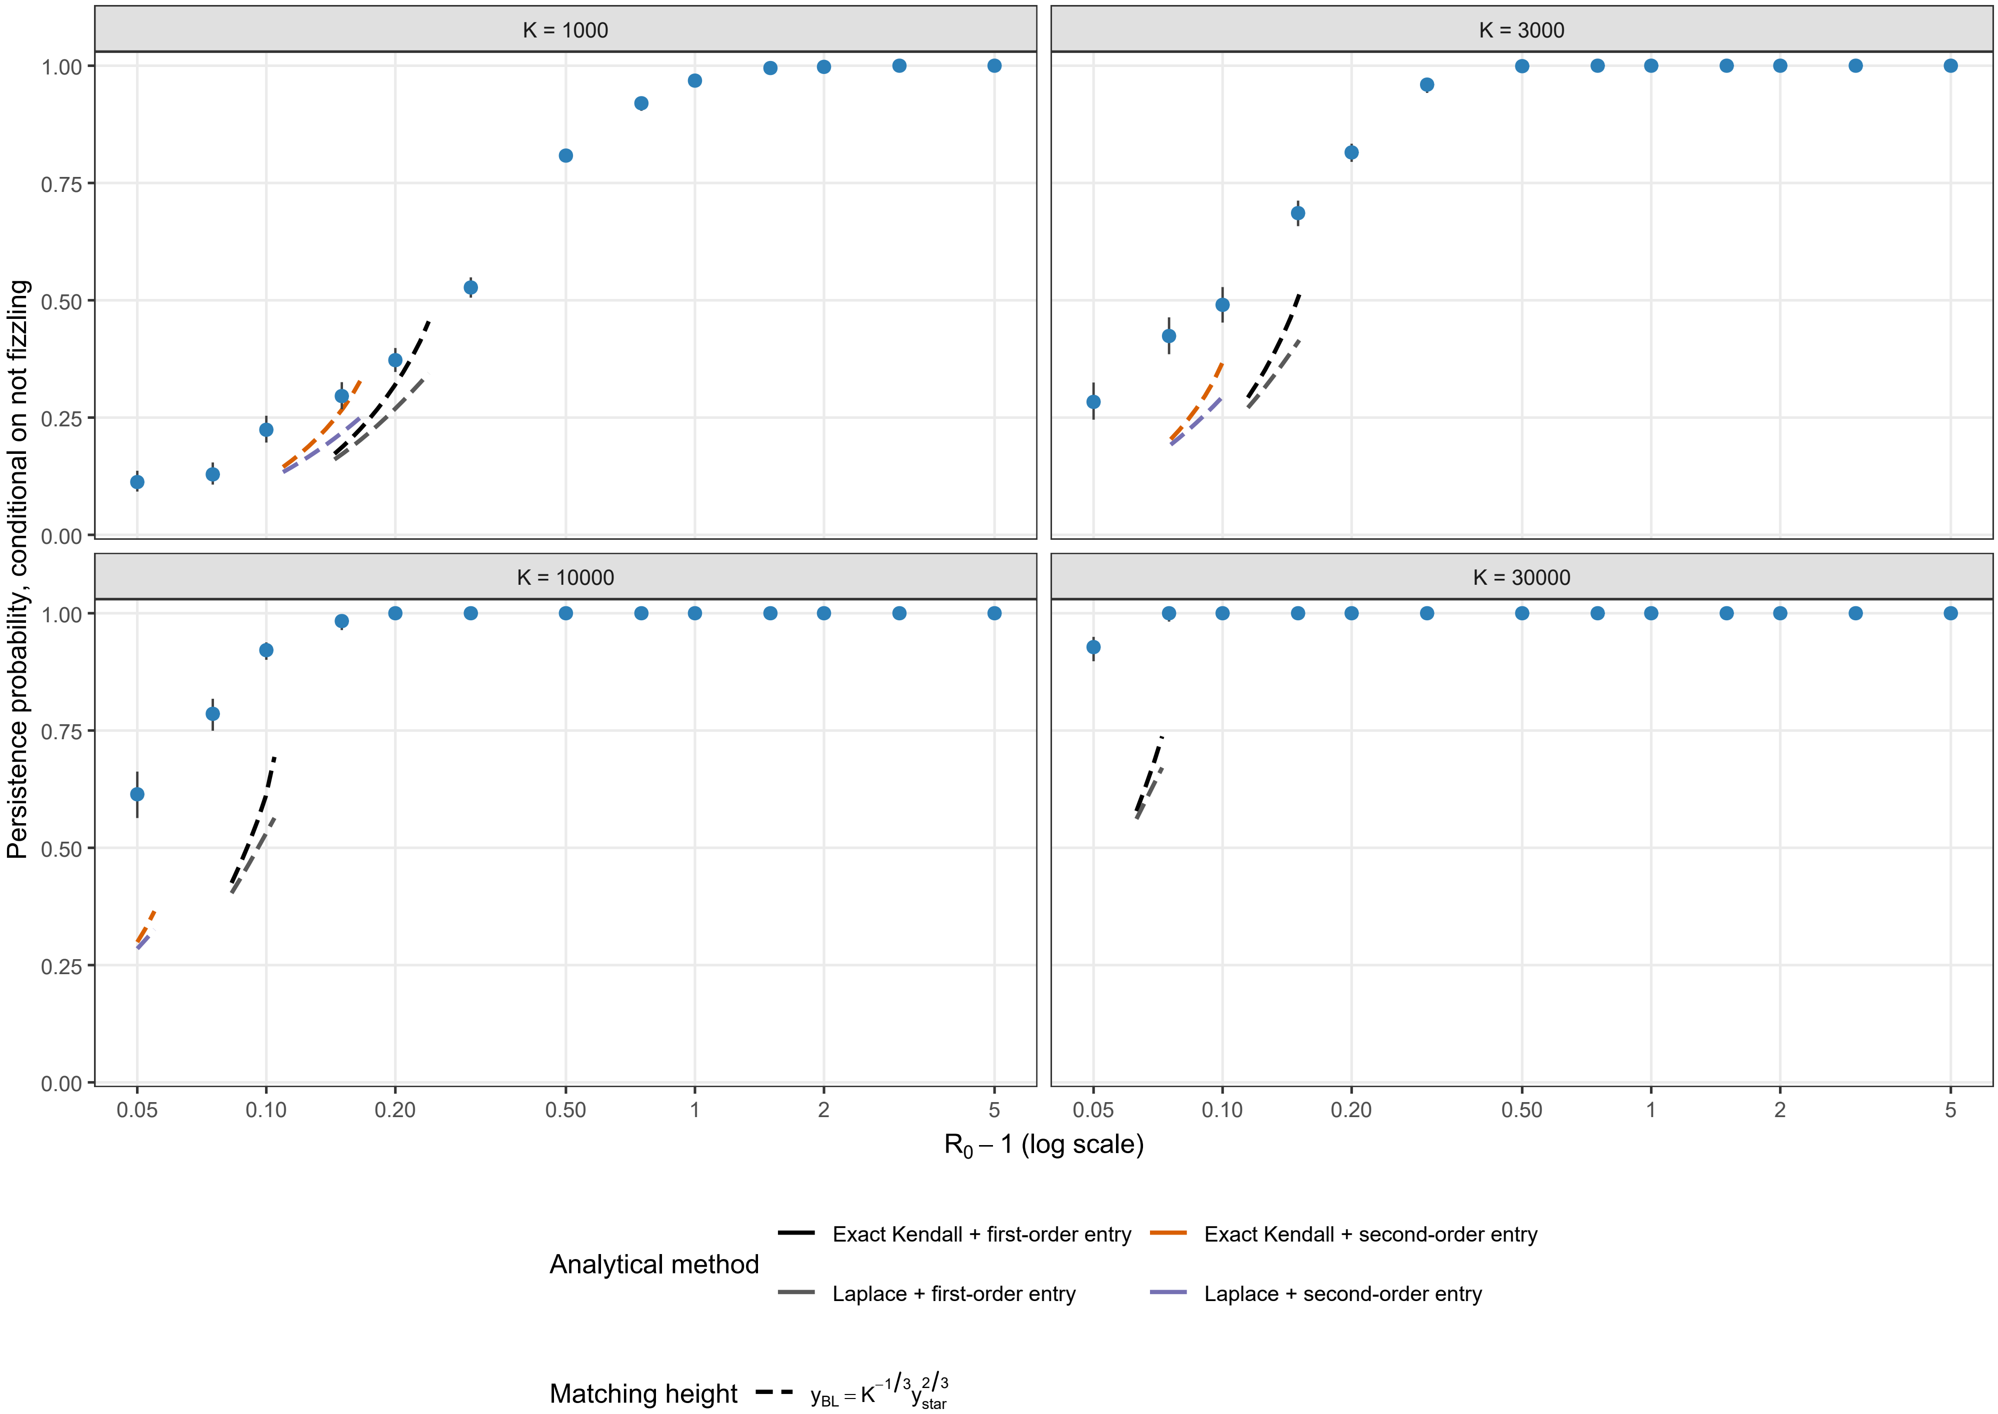
Exact Gillespie CTMC; rho = 0.05, theta = 1; I0 = 1; matching height = 2/3 compromise



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

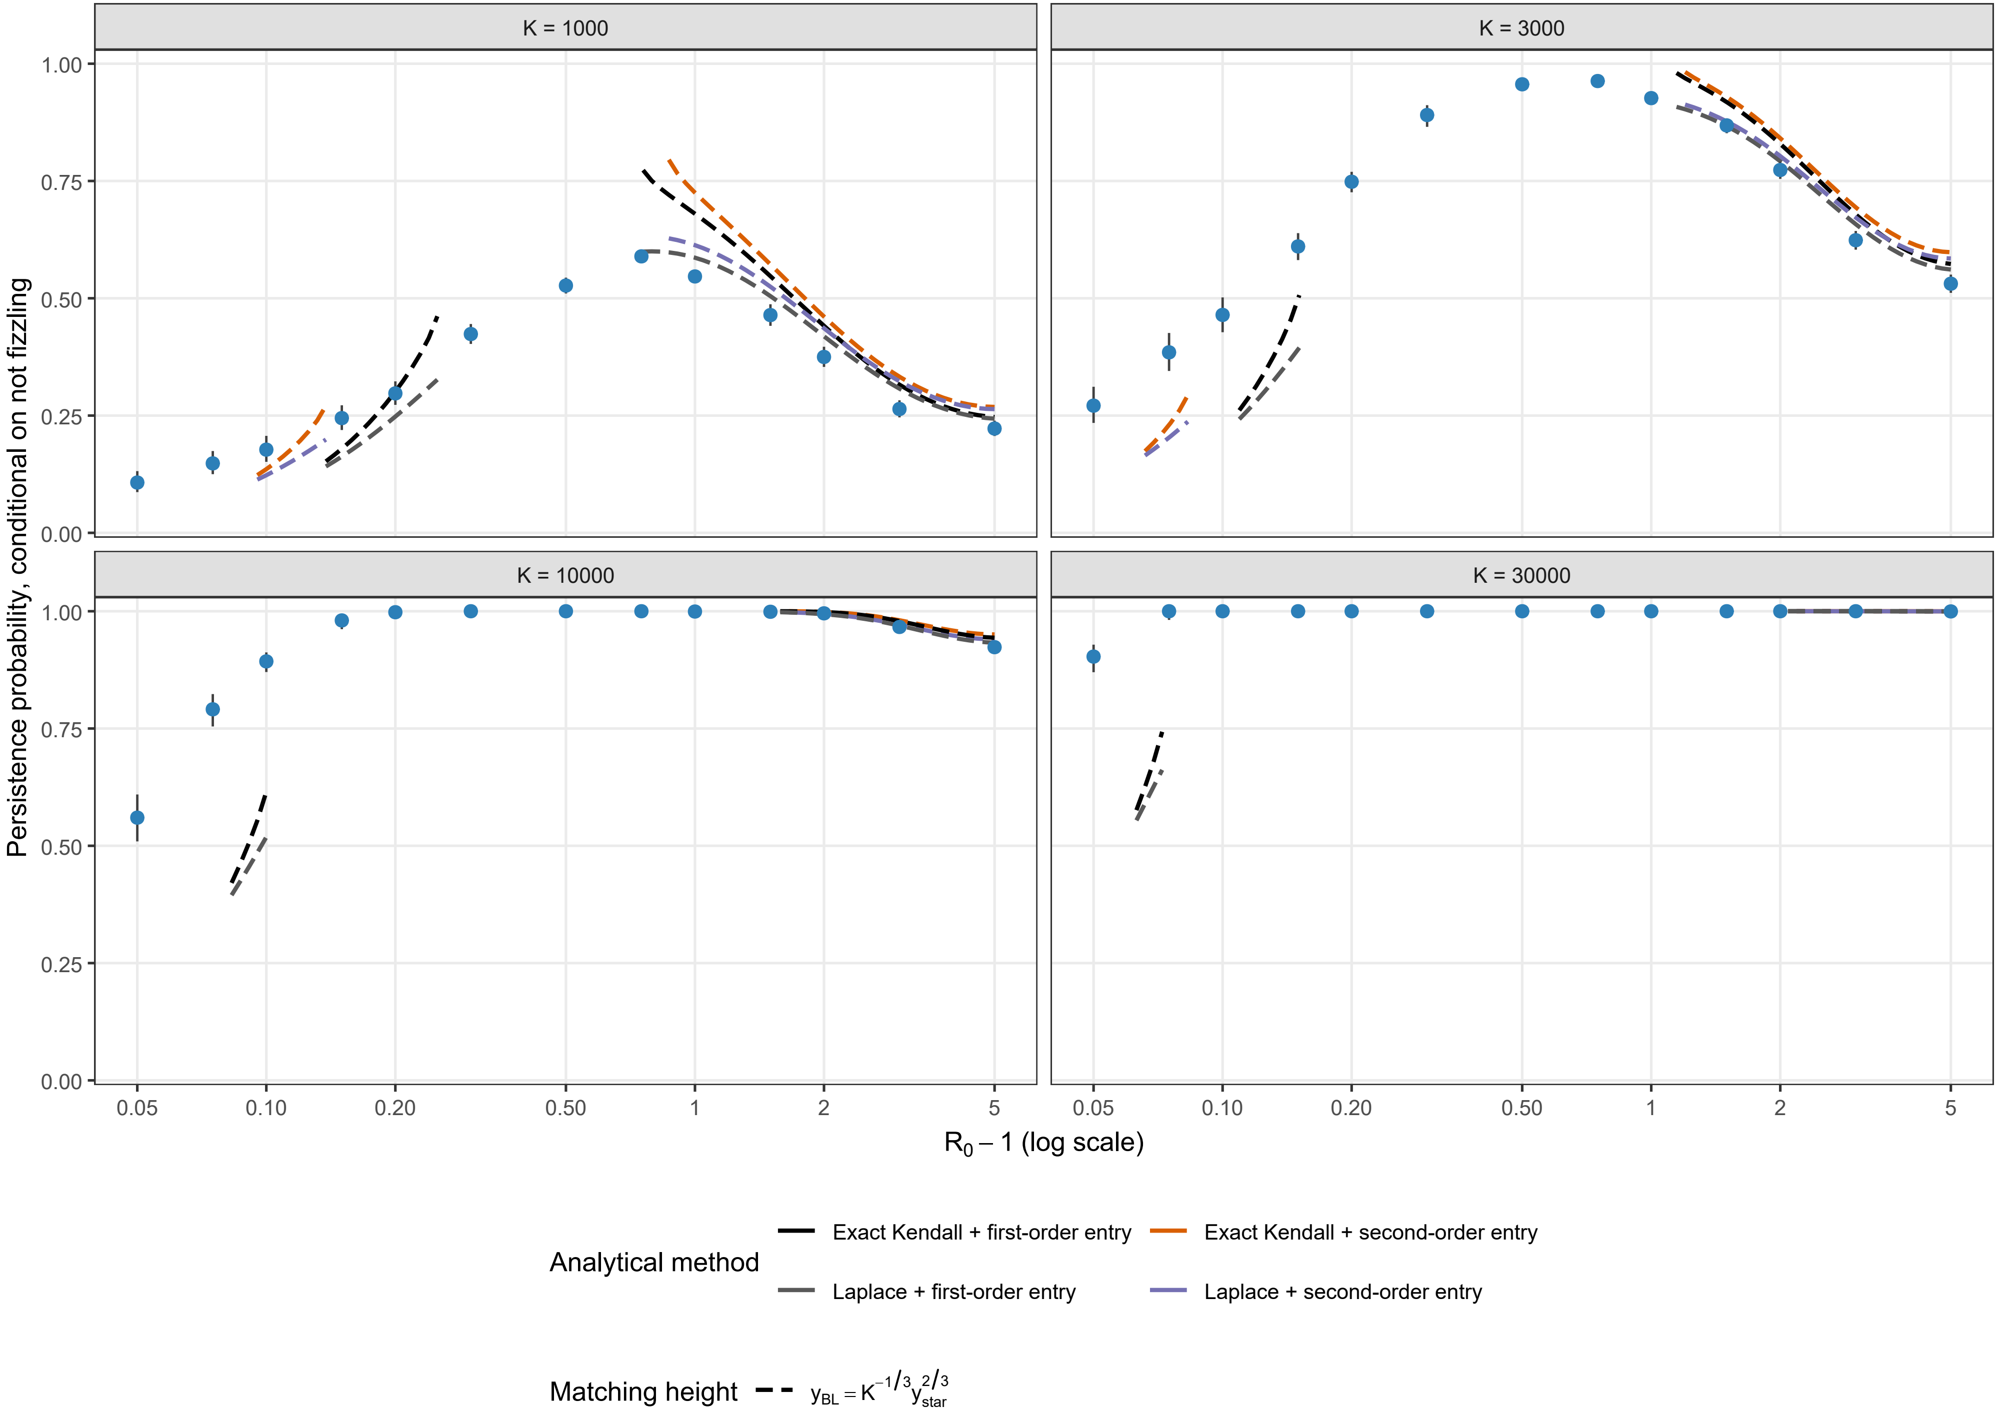
Exact Gillespie CTMC; rho = 0.10, theta = 0; I0 = 1; matching height = 2/3 compromise



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

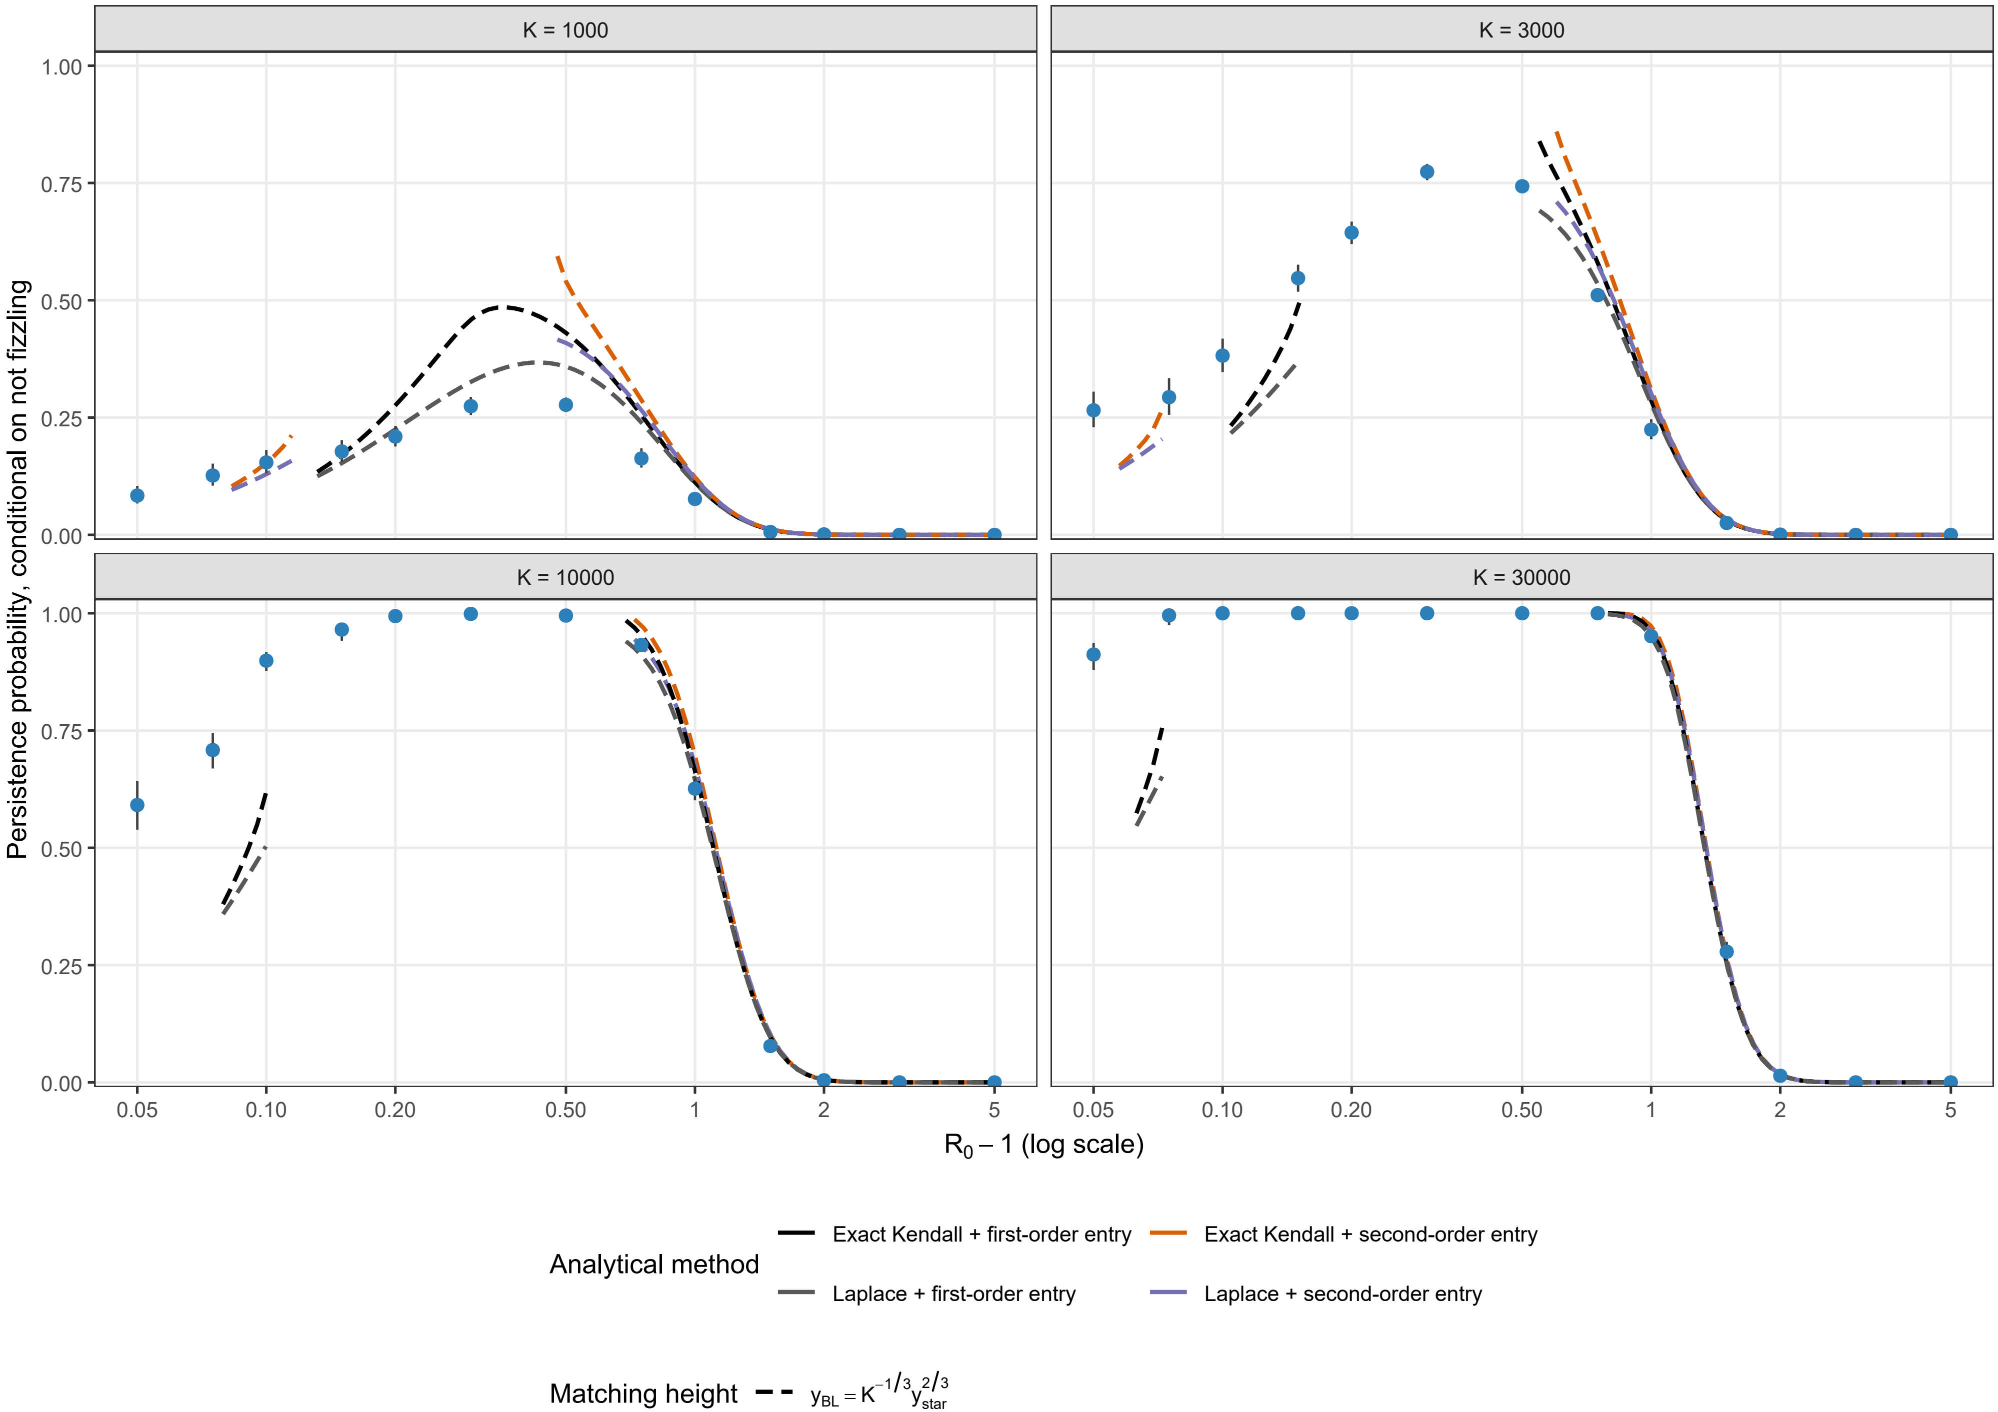
Exact Gillespie CTMC; rho = 0.10, theta = 0.5; I0 = 1; matching height = 2/3 compromise



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.

Stochastic validation conditional on escaping early fizzle

Exact Gillespie CTMC; rho = 0.10, theta = 1; I0 = 1; matching height = 2/3 compromise



Points and 95% Wilson intervals are stochastic estimates. All analytical curves use matching height 2/3 compromise.
Each curve stops where its matching equation has no admissible root.
