

Conditional persistence probability: condensed nonlinear-tail validation

psi = 0.5; reused stochastic estimates; finite-prevalence Kendall trough with low-prevalence action reference

Colour identifies rho. Solid/22/44 curves identify theta = 0/0.5/1; circle/triangle/square points identify the same theta values.
Heavy curves: finite-prevalence trough; pale thin curves: low-prevalence action. Curves are omitted outside the admissible descending-tail domain.
