

Transition-focused conditional persistence: $\psi = 1$, $\theta = 0.5$

The moving grid follows $R_0 = \rho \sqrt{K}/q$; grey bands mark near-0 and near-1 outcomes

Blue points and 95% Wilson intervals: adaptive tau-leaping pilot (epsilon = 0.01; 50-200 paths per point). Green triangles: numerical finite-horizon Kendall when the 2D ODE event solve is resolved. Missing green triangles indicate BAD_CROSSING_DIRECTION or NO_RECOVERY_PEAK, not zero probability.
