

Patch occupancy approximation: varying r

$R_0 = 2.5$; $K = 10,000$; $\alpha = 0.0001$; $\gamma = 1$; $n_{\text{patch}} = 200$; $dt = 0.1$; $t_{\text{max}} = 2000$

initialization = virgin_soil; $S(0) = K - 10$; $I(0) = 10$ per patch; $\tau = 50$

Solid curves use tau=50 established stochastic occupancy. Analytical time zero is the corresponding raw-occupancy minimum. P1 estimates at 0 or 1 were bounded for numerical calculation.
