

Stochastic validation conditional on escaping early fizzle

Non-seasonal single-patch logistic S-I model; $r = 0.1$; $I_0 = 1$

$P_{\text{cond_sim_established}} = n_{\text{persistence}} / (n_{\text{total}} - n_{\text{fizzle}})$. Points and intervals are stochastic adaptive tau-leap estimates with 95% Wilson Monte Carlo CI. The dashed orange curve uses the
