

Hybrid-duration two-state approximation: varying r

$R_0 = 2.5$; $K = 10,000$; $\alpha = 0.0001$; $\gamma = 1$; hybrid T_T ; $\tau = 50$
 $n_{\text{patch}} = 200$; $dt = 0.1$; $t_{\text{max}} = 2000$; $S(0)=K-10$; $I(0)=10$

$p(0)=P_1$; $q(0)=$ observed episode-classified transient occupancy at the aligned minimum. I_{bar_T} is deterministic, not fitted. T_T uses the $I=1$ -or-first-trough hybrid endpoint.
